"*Simony*, according to the canonists," says Ayliffe in his *Parergon*, "is defined to be a deliberate act or a premeditated will and desire of selling such things as are spiritual, or of anything annexed unto spirituals, by giving something of a temporal nature for the purchase thereof; or in other terms it is defined to be a commutation of a thing spiritual or annexed unto spirituals by giving something that is temporal." *Encyc. In the Arabian desert the simoon generally moves from south or east to north and west, and occupies from five to ten minutes in its passage; it is probably a whirlwind set in motion in the overheated air of the desert. The traveler seeks protection against the gusts of sand and the suffocating, dust-laden air, by covering his head with a cloth and throwing himself upon the ground; and camels instinctively bury their noses in the sand. The desiccating wind parches the skin, inflames the throat, and creates a raging thirst.

Dan. *synd* (not in Goth.), *sin*, akin to *L. san(t)-s*, sinful, guilty, *sautes*, dangerous, hurtful, and perhaps to Gr. *syn, syn*, mischief, harm. According to Curtius and others, the word is an abstract noun formed from the ppr. represented by *L. san(t)-s, en(t)-s*, being, and by AS. *soth*, true, sooth, = Icel. *sanur*, etc., lit. 'being (so)' (see *sooth*), Goth. *sunja*, the truth, sooth.] **1.** Any want of conformity unto or transgression of the law of God. (*Westminster Assembly's Shorter Catechism*.) The true definition of sin is much contested question, theologians being broadly divided into two schools of thought, the one holding that all sin consists in the voluntary and conscious act of the individual, the other that it also includes the moral character and disposition of the race; one that all moral responsibility is individual, the other that there is also a moral responsibility of the race as a race. To these should be added a third school, which regards sin as simply an imperfection and immaturity, and therefore requiring for remedy principally a healthful development under favorable conditions. Theologians also divide sin into two classes, *actual sin* and *original sin*. Actual sin consists in the voluntary conscious act of the individual. (See *actual*.) Original sin is the innate depravity and corruption of the nature common to all mankind. But whether this native depravity is properly called *sin*, or whether it is only a tendency to sin and becomes sin only when it is yielded to by the conscious voluntary act of the individual, is a question upon which theologians differ. Roman Catholic and other theologians, following the early church fathers, distinguish between *mortal* (or *deadly*) and *venial* sins. Mortal or deadly sins are such as willfully violate the divine law, destroy the friendship of God, and cause the death of the soul. The seven mortal or deadly sins are pride, covetousness, lust, anger, gluttony, envy, and sloth. Venial sins are such transgressions as are due to inadvertence, do not destroy the friendship of God, and, while tending to become mortal, are not in themselves the death of the soul. The difference is one of degree, not of kind.

And ye knowe also that it was do be me, and so sholde myn be the *synne*.
M. Clin (C. E. T. S.), i. 80.

Sure, it is no *sin*;

3. In *math.*, an exceptional element or character of a continuum. (a) In *geom.*, a projective character of a locus consisting in certain points, lines, or planes being exceptional in their relations to it. (For examples, see *binode*.) An ordinary singularity is one of a set of singularities of which all others are modifications or compounds. Thus, an actual node upon a skew curve is a modification of an apparent node, and ought not to be reckoned as an ordinary singularity. But cusps and inflections, as stationary points and tangents, are ordinary singularities. A higher singularity is one which differs indefinitely little from an aggregation of ordinary singularities. (See *tacnode*.) By an ellipsis common in geometrical language, the word singularity is used for point-singularity, or a relation to some exceptional point. Thus, a plane curve with neither nodes nor cusps is said to be without singularities, although, unless a conic, it has inflections, and unless a conic or cubic, double tangents. The word singularity is also used to denote the number of singular points, lines, or planes of any one kind; also for any number characteristic of a projective property, in which sense the order, class, and rank of a locus are sometimes termed singularities. (b) In the theory of functions, a property of a function consisting in it or its differential coefficient becoming discontinuous for a certain value or connected series of values of the variable.—**Elliptic, essential, hyperbolic singularity**. See the adjectives.—**Simple singularity**, a singularity of a function consisting in it or its differential coefficient becoming ambiguous or discontinuous at an isolated point or points, while remaining unambiguous and continuous at all other points sufficiently near to these.—**Syn.** 1. Uncommonness, oddness.—2. Idiosyncrasy. See *eccentric*. **singularization** (sing'gū-lār-i-zā'shon), n. [*< singularize + -ation*]. For this purpose the shorter leg is inserted in the liquid, and the air is exhausted by being drawn through the longer leg. The liquid then rises by the pressure of the atmosphere and fills the tube, and the flow begins from the lower end. Sometimes an ex-

hausting-tube (a in the figure) is placed on the longer leg; the air, in that case, is sucked out through a till the tube is filled to the cock b, which is then opened, and the flow commences—the cock b being so constructed as to close the suction-tube when the siphon is running. But the more general method is to fill the tube in the first place with the liquid, and then, stopping the mouth of the longer leg, to insert the shorter leg in the vessel; upon removal of the stop, the liquid will immediately begin to run. The flow depends upon the difference in vertical height of the two columns of the liquid, measured respectively from the bend of the tube to the level of the water in the vessel and to the open end of the tube. The flow ceases as soon as, by the lowering of the level in the vessel, this level descends to the end of the shorter leg. The atmospheric pressure is essential to support the column of liquid from the vessel up to the top of the bend of the tube, and this height is consequently limited, varying inversely with the density of the liquid. At sea-level the maximum height is a little less than 30 inches for mercury and 34 feet for water.

with holes equidistantly arranged in a circle, which can be revolved over a jet of compressed air or steam so as to produce periodic puffs. When the revolutions are rapid enough, the puffs coalesce into a musical tone. The revolution of the disk is effected either by a motor of some kind, or by setting the holes at an oblique angle so that the impact of the jet shall do the work. In the more complicated forms of the instrument two or more tones can be produced at once, either by having two or more concentric circles of holes in the same disk, or by two separate disks; the latter form is called a *double siren*. The number of revolutions required to produce a given tone can be counted and exhibited in various ways; and the application of the instrument in acoustical experiments and demonstrations is wide. In the cut *a* is a perforated disk made to revolve by the pressure of the air forced from the bellows beneath through *d*; *b*, vertical shaft revolving with the disk, and, by means of a pair of cog-wheels in the box *c*, turning the two index-hands on their respective dial-plates, and thus registering the number of revolutions made during the time of observation. Very large sirens are sometimes made for use as fog-signals, the sound being conveyed seaward in a large trumpet-shaped tube called a *fog-horn*, a name also given to the whole arrangement. See *fog-horn*. Also *sirene*.

American Manatee (*Manatus americanus*), one of the *Sirenia*.

The brain is small and particularly narrow. The petriotic and tympanic bones are ankylosed together, but not with the squamosal; the foramen magnum is posterior, directed somewhat downward; the lower jaw has a well-developed ascending ramus, a coronoid process, and an ordinary transverse condyle; and the teeth are molariform, adapted to chew herbage. The neck is moderate, and the axis has an odontoid process. The fore limbs are moderately developed, with a flexure at the elbow; the carpal, metacarpal, and phalangeal bones are directly articulated and of normal number. There are two mammae, pectoral. The heart is deeply fissured between the ventricles. (See first cut under *heart*.) In nearly all the above characters the *Sirenia* are contrasted with the *Cetacea*, which they resemble, and with which they were formerly classed as *Cetacea herbivora*. They are large or huge unwieldy and ungainly aquatic animals, inhabiting the sea-shores, bays, and estuaries of various countries, never going out to sea like cetaceans, nor ascending rivers far. They feed entirely on aquatic vegetation. There are only two living genera, *Manatus* and *Halicore*, the manatees and dugongs, representing two families, *Manatidae* and *Halicoridae*. The sea-cow, *Rhytina stelleri*, recently extinct, represents a third family, *Rhytinidae*. There are several other extinct genera, some of them constituting the family *Haliheriidae*. These terms being overlooked, the bird was renamed *Corvus speciosus* by Shaw, and the genus *Cissa* (later spelled *Kitta*) was founded upon it by Boie in 1826, since which time it has mostly been called *Cissa sinensis*, sometimes *C. speciosa*.

The fresh-molted plumage in life is a lovely green, but has the peculiarity of soon changing to verdigris-blue, as it does also in stuffed specimens, particularly if exposed to the light. This green or blue is varied with a black fillet encircling the head, with white tips and black subterminal bars on the tail-feathers and inner quill-feathers, and with bright sanguine red on the wings, which easily fades to a dull reddish-brown. A variety of the sirgang found in Sumatra is called *C. minor*; other species of the same genus are the Ceylonese *C. ornata* and the Japanese *C. thalassina*.

2. Sisters collectively, or a society of sisters; in religious usage, an association of women who are bound by monastic vows or are otherwise devoted to religious work as a vocation. In the Roman Catholic Church the members of a sisterhood may be bound by the irrevocable vows of poverty, chastity, and obedience, and are then called *nuns*, or may be merely under one rule and bound by revocable vows. In the Church of England and its offshoots there are also sisterhoods, the members of which either take a revocable vow of obedience to the rule of their association, or live under the rule of the order without vow. Among the more important of the sisterhoods are the Sisters of Charity (see *charity*), the School Sisters of Notre Dame, the Little Sisters of the Poor, the Sisters of the Assumption, the Congregation of Sisters of Notre Dame, the Anglican Sisterhoods of St. John the Baptist, of the Holy Communion, of St. Mary, etc. The Sisters of Mercy is an order founded in 1827 in Dublin, with purposes analogous to those of the Sisters of Charity. The vows are for life. A similar sisterhood in the Church of England was founded about 1845 for assisting the poor. It consists of three orders—those who live in community actively engaged in assisting the poor, those who live in community but are engaged in devotions and other secluded occupations, and those not living in the community but assisting it as co-workers. There are also a number of somewhat similar organizations in the Episcopal Church in the United States.

It is characterized by a narrow elongated pod or silique, with the seeds commonly in one row, and the seed-leaves incumbent and straight or in a few genera convolute or transversely plicate. It includes 21 genera, of which *Sisymbrium* is the type, chiefly plants of temperate regions. See *Sisymbrium*, *Hesperis*, and *Erysimum*.

Sisymbrium (si-sim'brī-um), *n.* [*NL. (Tournefort, 1700), < Gr. σισυμβριον, a name applied to certain odorous plants, one said to be a crucifer, another Mentha aquatica.*] A genus of cruciferous plants, type of the tribe *Sisymbrieæ*. It is characterized by annual or biennial smooth or hairy stems; flowers with free and unappended stamens, and a roundish and obtuse or slightly two-lobed stigma; and linear sessile pods, usually with three-nerved valves and many oblong seeds with straight cotyledons. It is destitute of the two-parted bristles found in the related genus *Erysimum*, which also differs in its linear or oblong leaves. Besides a great number of doubtful species, about 90 are recognized as distinct. They are natives especially of central and southern Europe, Siberia, and western Asia as far as India; a few are found in temperate and subarctic North America, and a very few in the southern hemisphere. They bear a stellate cluster of radical leaves, and numerous alternate stem-leaves which are usually clasping and irregularly lobed or pinnately divided. The flowers are usually borne in a loose bractless raceme, and are commonly yellow. The various species simulate the habit of many widely different genera. A few, constituting the subgenus *Arabisopsis* (A. P. de Candolle, 1823), have white, pink, or purplish flowers; two others, by some separated as a genus *Alliaria* (Adanson, 1763), have also broad or triangular heart-shaped undivided leaves, as *S. Alliaria*, the hedge garlic. For *S. officinale*, see *hedge-mustard* (sometimes used also for any plant of the genus); for *S. Sophia*, see *herb-sophia*; and for *S. Irio*, see *London-rocket*. *S. canescens* is the tansy-mustard of the western United States, and *S. Thaliana* the mouse-ear cross of Europe, naturalized in the eastern United States.

Sisyrinchieæ (sis'i-ring-kī'ē-ē), *n. pl.* [*NL. (Bentham and Hooker, 1883), < Sisyrinchium + -æ.*] A tribe of monocotyledonous plants of the order *Irideæ*. It is characterized by commonly terminal or peduncled spathe, by concave or keeled bracts within the spathe and opposite to the two or more usually pedicelled flowers, and by style-branches alternate with the anthers or borne on a style which is longer than the stamens. It includes 26 genera, classed in 4 subtribes, of which *Crocus*, *Cypripedium*, *Sisyrinchium*, and *Aristeria* are the types. The first, the *Crocaceæ*, are exceptional in their one-flowered spathe; they are largely South African and Australian. The *Cypripedeæ* and a few genera besides are American. The tribe includes both bulbous plants, as the *Crocus*, and others with a distinct creeping or upright rootstock, which is, however, in a larger number reduced to a cluster of thickened fibers. See *Pateronia* and *Pardonanthus*.

Sisyrinchium (sis-i-ring'ki-um), *n.* [*NL. (Tournefort, 1700), transferred by Linnaeus from the iris; < Gr. σισυρινχιον, a bulbous plant, said to have been of the iris family.*] A genus of plants of the order *Irideæ*, type of the tribe *Sisyrinchieæ* and of the subtribe *Ensisyrinchieæ*. It is characterized by round or two-edged stems without a bulbous base, rising from a cluster of thickened fibers; flowers with the filaments commonly partly united into a tube, and with three slender undivided style-branches; and a globose ovary which becomes an exerted capsule in fruit. There are about 50 species, all American, occurring both in the tropical and in the temperate zones, one species also indigenous in Ireland. They are tufted plants with numerous flat, long, and narrow upright leaves which are all or mostly radical, and usually a single spathe with numerous open flatish flowers. The two species of the eastern United States, *S. angustifolium* and *S. aeneum*, are known as *blue-eyed grass*, from the flowers. See *rush-lily*.

The Times remarked on the word *skedaddle*, and Lord Hill wrote to prove that it was excellent Scotch. The Americans only misapply the word, which means, in hum-fries, 'to spill, to kick out, for example, saying, "You are *skedaddling* all that milk."

H. Hen, *Slang Dictionary*, p. 292.

"Why," they [my English friends] exclaimed, "we used to live in Lancashire a head *skedaddle* every day of our lives. It means to scatter, or drop in a scattering way. If you run with a basket of potatoes or apples, and keep spilling some of them in an irregular way along the path, you are said to *skedaddle* them. Or if you carry a tumbler full of milk upstairs, and what the quincey would call the titubation of your gait causes a row of drops of milk on the stair-carp to mark your upward course, . . . you are said to have *skedaddled* the milk."

The Atlantic, xl, 234.

In *anat.*, the dry bones of the body taken together; hence, in *anat.* and *zool.*, some or any hard part, or the set of hard parts together, which form a support, scaffold, or framework of the body, sustaining, inclosing, or protecting soft

More specifically—(a) The test, shell, lorica, or set of spicules of any protozoan, as an infusorian, radiolarian, foraminifer, or other animalcule, exhibiting the utmost diversity of form, structure, and substance. See cuts under *Foraminifera*, *Infusoria*, and *Radiolaria*. (b) In sponges, the whole sponge except the animalcules which fabricate it. (See cut under *Porifera*.) A bath-sponge, for example, is only the skeleton, from which the animals have been decomposed and displaced. This skeleton presents itself in three principal textures, the fibrous, chalky, and glassy. In a few cases it is gelatinous. (See *Fibropungtia*, *Calcipungtia*, *Silicispungtia*, *Myrospongia*.) A nearly constant and very characteristic feature of sponge-skeletons is the presence of calcareous or silicious spicules. (See *spicule*.) Spicules in excess of fibrous tissue, and especially when consolidated in a kind of network, form the glass sponges, some forms of which are very beautiful. (See cut under *Euplectella*.) Certain minute sponges of some sponges are flesh-sponges, and belong to the individual sponge-animalcules rather than to the general sponge-tissue. (Compare *microsclere* with *mesosclere*.) (c) The special or general hard parts of echinoderms, as the shell of a sea-urchin with its spines and oral armature; the spicules or scleres in the integument of a holothurian; the rigid parts of starfishes, crinoids, and the like. fishes the whole skeleton is cartilaginous. In most vertebrates, however, the cartilage forming the skeleton of the embryo or fetus is mainly converted into bone by the process of ossification, or deposition of bone-earth, some parts, especially of the ribs, remaining as a rule cartilaginous. The vertebrate endoskeleton consists of axial parts, the *axial skeleton*, in a series of conservative segments, the vertebrae, with their immediate offshoots, as ribs, and at the head end a skull or cranium (except in the *Acerania* or lowest fishes); and of appendages (except in the *Acerania* or lowest fishes), represented by the one or two (never more) pairs of limbs, if any, including the pectoral and pelvic arch, or shoulder- and hip-girdle, by means of which the limbs are attached to the axis or trunk. Various other ossifications may be and usually are developed in

tendinous or ligamentous tissue, or in viscera, and constitute the *schrosteleion* or *splanchnosteletion*. Teeth are certainly skeletal parts, though not usually counted with

The fourteen facial bones are two nasals, two lacrymals, two superior maxillaries, two malars, two palatals, two inferior maxillaries, one inferior maxillary, and one vomer. This enumeration of the bones is exclusive of the bonelets of the ear, which, however, are counted in vertebrates below mammals. Of these bones, the mandible, vomer, and frontal are really paired, or of lateral halves; the supramaxillary, ethmoid, sphenoid, occipital, and temporal are compound bones of several separate centers of ossification; the rest are simple. The most composite bone is the temporal, whose ankylosed stylohyoid process (peculiar to man) is an element of the hyoid arch. A skull of similar construction characterizes mammals at large, though its figure is usually quite different (owing mainly to production of the facial and reduction of the cranial parts), and though some of the bones which are confluent in man may remain distinct. In birds the skull is characterized by the great size of the cranial bones in comparison with that of the facial bones (ex-

cepting the specially enlarged intermaxillary and infra-maxillary), the extensive and complete ankyloses of cranial bones, the permanent and perfect distinctness of pterygoid

C, Base of Human Skull, left side, interior or cerebral surface; a, alisphenoid, or greater wing of sphenoid; b, basihyal; c, body of hyoid bone; d, occipital condyle; e, ceratohyal; f, lesser cornu of hyoid; g, dotted line representing the course and attachments of the stylohyoid ligament; h, styloid; i, coronal suture; k, coronal process of mandible; l, condyle of mandible; m, frontal bone; n, malar or jugal bone; o, lacrymal bone; p, nasal bone; q, nasal process of the maxilla; r, lambdoid suture; s, mastoid process of temporal; t, mandible; u, maxilla; v, superior maxillary bone; w, nasal bone; x, occipital bone; y, parietal bone; z, pterygoid process of sphenoid; aa, squamosal suture of temporal; ab, styloid process of temporal bone (or stylohyoid); ac, thyrohyal; ad, greater cornu of hyoid.

bones, the formation of each half of the lower jaw by several recognizable pieces, and especially by the intervention of a movable quadrate bone between the squamosal and the mandible. Some other additional bones make their appearance; and the occipital condyle is always single. A skull of similar construction to that of birds characterizes reptiles proper; but here again the cranium is small in comparison with the facial region (as in the lower mammals), sometimes excessively so; the skull is more loosely constructed, with fewer ankyloses of its several elements; and some additional bones not found in any higher vertebrates first appear. The skulls of batrachians differ widely from all the above. Some additional elements appear; some usually ossified elements may be persistently cartilaginous; and branchial as well as hyoidian arches are seen to be parts of the skull. The further modifications of the skull in fishes are great and diversified; not only is there much variation in the skulls of different fishes, but also the difference between any of their skulls and those of higher vertebrates is so great that some of the bones can be only doubtfully homologized with those of higher vertebrates, while of others no homologues can be recognized. In these ichthyopsian vertebrates, also, the skull is sometimes permanently cartilaginous, as in selachians; in the lampreys the lower jaw disappears; in the lancelets there is no skull. In fishes, also, more or fewer branchial arches are conspicuous parts of the skull, forming usually, with the compound lower jaw, by far the bulkier section of this collection of bones; and in some of them the connection of the shoulder-girdle with the skull is such that it is not always easy to say of certain bones whether they are more properly scapular or cranial. The natural evolution of the skull is, of course, from the lower to the higher vertebrates (the reverse of that above sketched). Above lampreys and hags, after a lower jaw has been acquired, the general course of evolution of the skull is to the reduction in number of its bones or cartilages by the entire disappearance of some and the confluence of others, tending on the whole to the compactness, simplicity, and symmetry of which the human skull is the extreme case, and in which, as in the skull of any mammal or bird, evidences of its actual osseous elements are chiefly to be traced in the transitory centers of ossification of the embryo. A good illustration of this is witnessed in the condition of the bones of the tongue (hyoid arch) in mammals; for even in birds (next below mammals) the tongue has a skeleton of several distinct bones, the position of which in a series of arches next after the mandibular and next before the branchial arches proper is evident. The base of the skull is generally laid down in cartilage. The dome of the skull and the facial parts are usually of membrane-bones; and to the latter some dermal or exoskeletal bones may be added. Facial parts of all skulls are of different character from cranial parts proper, in that they belong essentially to the series of visceral (hemal, not neural) arches: (1) upper jaw; (2) lower jaw; (3) tongue (hyoid), followed by more or fewer successive branchial arches. The neural arches, or cranial segments proper, are at least 3 (some count 4) in number, named occipital, parietal, and frontal, from behind forward, represented respectively by (1) the occipital bone; (2) the basisphenoid, alisphenoid, and parietal bones; (3) the presphenoid, orbitosphenoid, and frontal bones. With these are intercalated or connected the sense-capsules of the three higher senses—namely, of hearing, sight, and smell—these being the skeletons of the ear, eye, and nose, or the petrosal parts of the temporal, the sclerotic coat of the eye, and the lateral masses of the ethmoid bone. Remaining hard parts of the head, and, as such, elements of the skull, are the teeth, borne on more or fewer bones: in mammals, when present, confined to the premaxillaries, supramaxillaries, and infamaxillaries; not present in any existing birds; in various reptiles and fishes, absent, or

borne upon the bones above named, and also, in that case, upon the sphenoid, vomer, palatals, pterygoids, hyoids, pharyngeals, etc. The body of facts or principles concerning skulls is craniology, of which craniometry is one department, especially applied to the measurement of human skulls for the purposes of ethnography or anthropology. skunk early attracted attention. It is mentioned in 1636 by Sagard-Théodat by several terms based on its Indian names, as *seangressse*, *ouinesspe*, etc., and in the same passage, in his "History of Canada," this author calls it in French "*enfant du diable*," a name long afterward quoted as specific. It is the *iskutta* of Kalm's "Travels," commonly translated *polecat*, a name, however, common to various other ill-scented *Mustelida*. (See def. 2.) *Chinche*, *chinga*, and *moufette* (specifically *moufette d'Amérique*) are book-names which have not been Englished. The New Latin synonyms are numerous. The animal inhabits all of temperate North America, and continues abundant in the most thickly settled regions. It is about as large as a house-cat, but stouter-bodied, with shorter limbs, and very long bushy tail, habitually erected or turned over the back. The color is black or blackish, conspicuously but to a variable extent set off with pure white, generally as a frontal stripe, a large crown-spot, a pair of broad divergent bands along the sides of the back, and white hairs mixed with the black ones of the tail. The fur is valuable, and when dressed is known as *black-sable*; the blackest pelts bring the best price. The flesh is edible, when prepared with sufficient care. The skunk is carnivorous, like other members of the same family, with which its habits in general agree; it is very prolific, bringing forth six or eight young in burrows. The fluid which furnishes the skunk's almost sole means of defense was long supposed and is still vulgarly believed to be urine. It is the peculiar secretion of a pair of perineal glands (first dissected by Jeffries Wyman in 1844), similar to those of other *Mustelida*, but very highly developed, with strong muscular walls, capacious reservoir, and copious golden-yellow secretion, of most

slang³ (slang), *n.* [Of obscure cant origin; the form suggests a connection with *sling*, in a way indicated by the use of *sling* and *fling* in 'to sling epithets,' 'to fling reproaches,' etc., and by similar uses of related Scand. forms, as Norw. *sleng*, a slinging, a device, a burden of a song; *slengja*, sling (*slengja kjeften*, abuse, lit. 'sling the jaw'); *slengjennom*, a nickname; *slengje-ord*, an insulting word or allusion; Icel. *slyngur*, *slyngun*, cunning; see *sling*¹. The noun, in this view, must have arisen in quasi-composition (*slang*-patter, *slang*-word, *slang*-name, etc.), or else from the verb. Evidence of early use is lacking. The word has nothing to do with language or lingo, and there is no evidence to establish a Gipsy origin.] 1. The cant words or jargon used by thieves, piddlers, beggars, and the vagabond classes generally; cant.

Slang in the sense of the cant language of thieves appears in print certainly as early as the middle of the last century. It was included by Grose in his "Dictionary of the Vulgar Tongue," published in 1785. But it was many years before it was allowed a place in any vocabulary of our speech that confined itself to the language of good speakers and writers. Its absence from such works would not necessarily imply that it had not been in frequent use. Still, that this never had been the case we have direct evidence. Scott, in his novel of "Redgauntlet," which appeared in 1824, when using the word, felt the necessity of defining it; and his definition shows not only that it was generally unknown, but that it had not then begun to depart at all from its original sense. In the thirteenth chapter of that work, one of the characters is represented as trying to overhear a conversation, . . . but . . . "what did actually reach his ears was disguised so completely by the use of cant words and the thieves' Latin called *slang* that, even when he caught the words, he found himself as far as ever from the sense of their conversation." No one who is now accustomed either to speak slang (in def. 2), or to speak of the users of it, would think of connecting it with anything peculiar to the language of thieves. Yet it is clear from this one quotation that the complete change of meaning which the term has undergone has taken place within a good deal less than sixty years.

The Nation, Oct. 9, 1890, p. 289.

Let proper nurses be assigned, to take care of these babes of grace (young thieves). . . . The master who teaches them should be a man well versed in the cant language commonly called the *slang* patter, in which they should by all means excel.

Jonathan Wild's Advice to his Successor (1758). (*Hotten*.)

2. In present use, colloquial words and phrases which have originated in the cant or rudespeech of the vagabond or unlettered classes, or, belonging in form to standard speech, have acquired or have had given them restricted, capricious, or extravagantly metaphorical meanings, and are regarded as vulgar or inelegant. Examples of slang are *run for 'squer'*, *gay* for 'disolute,' *corned*, *tight*, *stuck*, etc., for 'intoxicated,' *carefully* for 'exceedingly,' *jolly* for 'surprising, uncommon,' *daisy* for something or somebody that is charming or admirable, *kick the bucket* or *hop the twig* for 'die,' etc. This colloquial slang also contains many words derived from thieves' cant, such as *pal* for 'partner, companion,' *core* for 'fellow,' and *ticker* for 'watch.' There is a slang attached to

certain professions, occupations and classes of society, such as *being down*, college *slang*, club *slang*, literary *slang*, political *slang*. (See *cant*2.) Slang enters more or less into all colloquial speech and into inferior popular literature, as novels, newspapers, political addresses, and is apt to break out even in more serious writings. Slang as such is not necessarily vulgar or ungrammatical; indeed, it is generally correct in idiomatic form, and though frequently censured on this ground, it often, in fact, owes its doubtful character to other causes. Slang is often used adjectively, as, a *slang* expression. See the quotations below.

The smallest urethra whose tongue could tang
Shook'd the dame with a volley of *slang*.
Wood, Tale of a Trumpet.

Cant, as used in the phrases "thieves' cant," "tinkers' cant," "printers' cant," or the cant of any craft or calling, is really a language within a language, and is intended to conceal the thoughts of those who utter it from the uninitiated. *Slang*, on the other hand, is open to all the world to use, and its ranks are recruited in various ways. *N. and Q.*, 5th ser. VIII. 331.

Center slang, thieves' slang in which the middle vowel of a word is taken as its initial letter, and other letters or syllables are added to give the word a finish, as *lock* becomes "ockler," *pick*, "itelper," etc. *Edison Turner*, *Vagrants and Vagrancy*, p. 478.—**Rimming slang**, a kind of cant or secret slang spoken by street vagabonds in London, consisting of the substitution of words or sentences which time with other words or sentences intended to be kept secret; as, "apples and pears" for *stairs*; "Cain and Abel" for *a table*. 3. A rock the most striking characteristic of which is its fissile structure, or capability of being easily split or cleft into thin plates of nearly uniform thickness and smooth surfaces. The rocks in which a fissile structure is particularly well developed are almost exclusively the argillaceous, and those which have been more or less metamorphosed, and this fissility appears to be the result of the rearrangement of the particles of the rock into new combinations flattened into thin scales which lie in a direction at right angles to the direction in which the rock was pressed at the time the metamorphism was taking place. The best-known variety of slate is the common roofing-slate, which is compact, homogeneous, and fissile enough to be used for covering roofs, or for manufacture into tables, chimney-pieces, writing slates, etc. The valuable varieties of roofing-slate come almost exclusively from the older metamorphic rocks. (See *cleavage and foliation*.) North Wales is by far the most important slate-producing region of the world, some beds having been worked there as early as the twelfth century. The principal quarries are in southern Carnarvonshire and Merionethshire in the Lower Silurian, and in Montgomeryshire in the Upper Silurian. There are also quarries in Cornwall in the Devonian, and slates of the same geological age are obtained in France in considerable quantity, as well as in parts of Germany adjacent to the Rhine. There are various quarries in Devonshire in the Carboniferous; but in most of them the slate furnished is not of first-rate quality; and, in general, it may be said that the Carboniferous is the highest geological formation producing what can properly be denominated *slate*. The slate of the United States comes almost entirely from a very low position in the geological series, as is also the case in Europe. Pennsylvania and Vermont are the principal slate-producing states, and they together furnish more than two thirds in value of the total production of the country.

Slumber, *Sleep*, nap, rest, repose. The first four words ex-
press the stages from full consciousness to full uncon-
sciousness in sleep. *Sleep* is the standard or general word.
Drowse expresses that state of heaviness when one does
not quite surrender to sleep. *Doze* expresses the endeavor
to take a sort of waking nap. *Slumber* has largely lost its
earlier sense of the light beginning of sleep, and is now
more often an elevated or poetical word for sleep.

II. *trans.* 1. To take rest in; with a cognate
object, and therefore transitive in form only:

fall, slide; see *labent*, *lapse*. No cognate form
of this verb is found in Scand. (where another
verb, cognate with the L., Gr., and Skt. words
for 'sleep,' appears; see *surven*).] 1. *Intrans.* 1.
A state of general marked quiescence of volun-
tary and conscious (as well as many involun-
tary and unconscious) functions, alternating
more or less regularly with periods of activity.
In human sleep, when it is deep, the body lies quiet, with
the muscles relaxed, the pulse rate lower than during the
waking hours, and the respiration less frequent but deep,
while the person does not react to slight sensory stimuli.
Intestinal peristalsis is diminished; secretion is less ac-
tively carried on; the pupils are contracted; and the brain
is said to be anemic. If the depth of sleep is measured by
the noise necessary to awaken the sleeper, it reaches its
maximum within the first hour and then diminishes, at first
rapidly, then more slowly.

Half in a dreme, not fully weel a-wakid,
The golden sleep me wrapt vndir his wing.
Political Poems, etc. (ed. Furnivall), p. 52.

Else could they not catch tender sleep; which still
Is shy and fearful, and flies every voice.

J. Beaumont, Psyche, iv. 41.

Sleep is a normal condition of the body, occurring peri-
odically, in which there is a greater or less degree of uncon-
sciousness due to inactivity of the nervous system and
more especially of the brain and spinal cord. It may be
regarded as the condition of rest of the nervous system
during which there is a renewal of the energy that has
been expended in the hours of wakefulness.

Encyc. Brit., XXII. 154.

2. A period of sleep; as, a short sleep.

It seems his *sleeps* were hindered by thy railing.
Shak., C. of L., v. 1. 71.

On being suddenly awakened from a *sleep*, however pro-
found, we always catch ourselves in the middle of a dream.
W. James, Prin. of Psychol., 1. 201.

3. Repose; rest; quiet; dormancy; hence, the
rest of the grave; death.

Here are no storms,
No noise, but silence and eternal sleep.

Shak., Tit. And., i. 1. 155.

A calm, unbroken sleep
Is on the blue waves of the deep.

Predella, To an Absent Wife.

4. Specifically, in *zool.*, the protracted and pro-
found dormancy or torpidity into which various
animals fall periodically at certain seasons of
the year. Two kinds of this sleep are distinguished as
summer and *winter sleep*, technically known as *estivation*
and *hibernation* (see these words).

5. In *bot.*, nyctitropism, or the sleep-movement
of plants, a condition brought about in the foli-
ar or floral organs of certain plants, in which
they assume at nightfall, or just before, posi-
tions unlike those which they have maintained
during the day. These movements in the case of leaves
are usually drooping movements, and are therefore sug-
gestive of rest, but the direction of movement is different

in different cases. Thus, among the *Orchidaceae* the sleep-
movement consists in the downward sinking of the leaf-
lets, which become at the same time folded on them-
selves. Among the *Leguminosae*, the leaflets, in some cases,
simply sink vertically downward (*Phaseolus*); in others,
they sink down while the main petiole rises (terminal
leaflet of *Desmodium*); in others, they sink downward
and twist on their axes so that their upper surfaces are in
contact beneath the main petiole (*Cassia*); in others, again,
they rise and bend backward toward the insertion of the
petiole (*Coronilla*); in others, they rise, and the main
petiole rises also, whereas in *Mimosa pudica* the leaflets
rise and bend forward, while the main petiole falls. In
Marsilea the leaflets rise up, the two upper ones being em-
braced by the two lower. (S. H. Vines.) The mechanism
of these movements is explained by Hoffer and others as
due to an increased growth on one side of the median line
of the petiole or midrib, followed, after a certain interval
of time, by a corresponding growth on the opposite side.
It is also accomplished by simple turgescence of opposite
sides. The utility of the sleep-movements is believed to
consist in protection from too great radiation. The cause
or causes of these movements (and of analogous move-
ments which have been called *diurnal sleep*; see the
second quotation) are only imperfectly known, but they
are undoubtedly largely due to sensitiveness to variations
in the intensity of light. See *nyctitropism*.

Those movements which are brought about by changes
in the amount of light constitute what are known as the
"sleep" and "waking" of plants. Bessey, Botany, p. 198.

There is another class of movements, dependent on the
action of light. . . . We refer to the movements of leaves
and cotyledons which when moderately illuminated are
dieliotropic, but which change their positions and pre-
sent their edges to the light when the sun shines brightly
on them. These movements have sometimes been called
diurnal sleep. Darwin, Movement in Plants, p. 445.

On sleep, asleep. See *asleep*.

other material upon which the rails or the rail-chairs of a
railway rest, and to which they are fastened. Wood of
durable varieties is far more extensively used for this
purpose than any other material; but stone, toughened glass,
and iron have also been used, the last to a considerable
extent. In some instances the sleepers are laid longitu-
dinally with the rails, and bound together by cross-ties.
This system is in use on some important European rail-
ways, and generally on elevated railways and street rail-
ways, both in the United States and elsewhere; but the
most common method is to lay the sleepers at right angles
to the rails, and about 2 feet from center to center, except
when they support points and angle-bars, when they are
placed 1 foot 6 inches from center to center. They are
thus made to act both as sleepers and as cross-ties. Such
sleepers are in the United States also called *railway-ties*
or simply *ties*. See *cut* under *rail-chair*.

slickensides (slik'n-sīdz), *n. pl.* [< *slucken* + *sides*, pl. of *side*¹.] In *mining*, polished and striated surfaces of the rock, often seen on the walls of fissure-veins, and the result of motion, under immense pressure, of parts of the country-rock, or of the mass of the vein itself. Well-developed slickensides are most frequently seen in connection with mineral veins, but the sides of joints in non-metaliferous rocks occasionally exhibit this kind of striation. Slickensided surfaces are frequently coated with a thin film of pyrites, galena, hematite, or some other mineral, which may be polished so as to reflect the light like a mirror (whence the French name *miroirs*).

Nearly akin to this striated character are the *slicken-sides*, or polished and striated surfaces, which, sometimes of iron pyrites, but more usually of copper pyrites, often cover the faces of the walls of holes.

Henwood, Metalliferous Deposits of Cornwall and Devon, p. 181.

slickensiding (slik'n-sī-ding), *n.* [< *slickenside* + *-ing*.] The formation of slickensides.

In every case I think these bodies must have had a solid nucleus of some sort, as the severe pressure implied in *slickensiding* is quite incompatible with a mere fluidity, even supposing this to have existed.

As facilitating alterations of pitch in pure intonation, it has decided advantages over both keys and valves. A special form of slide, called the *tuning-slide*, is used in almost all metal wind-instruments simply to bring them into accurate tune with others. See *cut under trombone*. (d) In *organ-building*, same as *slider*, 1 (f). (e) In *racine boats*, a sliding seat. Also *slider*.

carrying a jib, fore-staysail, mainsail, and gaff-top-sail. Some sloops formerly had a square topsail. It is generally understood that a sloop differs from a cutter by having a fixed instead of a running bowsprit, but the names are used somewhat indiscriminately. In the days of sailing vessels, and of the earlier steam naval marine, now becoming obsolete, a *sloop of war* was a vessel of ship-rig carrying guns on the upper deck only, and rather smaller than a corvette. See also *cut under cutter*.

4. A South American tardigrade edentate mammal of the family *Bradypodidae*: so called from their slow and apparently awkward or clumsy movements. The slowness of their motions on the ground is the necessary consequence of their disproportioned structure, and particularly of the fact that the feet exhibit a conformation resembling that of club-foot in man—a disposition of the carpal and tarsal joints highly useful in climbing. Sloths live on trees, and never remove from one until they have stripped it of every leaf. They are helpless when on the ground, and seem at home only on trees, suspended beneath the branches, along which they are sometimes observed to travel from tree to tree with considerable celerity. The female produces a single young one at a birth, which she carries about with her until it is able to climb. Sloths are confined to the wooded regions of tropical America, extending northward into Mexico. At least 12 species are described, but the true number is fewer. All have three toes on the hind feet, but some have only two on the fore feet, whence the obvious distinction of *three-toed* and *two-toed* sloths (a distinction even more strongly marked in the anatomy of these animals) warranted a division of the family into *Bradypodinae* (*Bradypodinae*) and *Choloepodinae* (*Choloepodinae*). Most sloths belong to the former group, and these have the general name *ai*. The best-known of these is the collared three-toed sloth, *Bradypus tridactylus* or *torquatus*, with a sort of name. The man or two-toed sloth, *Choloepus didactylus*, inhabits Brazil; it is entirely covered with long coarse woolly hair. (See cut under *Choloepus*.) A second and quite distinct species of this genus, *C. hoffmanni*, inhabits Central America. (See *Tardigrada*, 1.) The name is apparently a translation of the Portuguese word *preguiça* (Latin *pigritudo*), slowness, slothfulness. See the quotation.

Here (in Brazil) is a Beast so slow in motion that in fifteen days he cannot go further than a man can throw a stone; whence the Portuguese call it *Pieritia*.

smell (smel), *n.* [Cf. ME. *smel*, *smil*, *smul*, *smecal*, *smol* (not found in AS.); see the verb.] 1. The faculty of perceiving by the nose; sense-perception through the olfactory nerves; the olfactory faculty or function; the physiological process or function whereby certain odoriferous qualities of bodies, as scent or effluvium, are perceived and recognized through sensation; olfaction; scent: often with the definite article, as one of the special senses: as, the *smell* in dogs is keen. The essential organ of smell is located in a special part or lobe of the brain, the rhinencephalon, or olfactory lobe, whence are given off more or fewer olfactory nerves, which pass out of the cranial cavity into the nasal organ, or nose, in the mucous or Schneiderian membrane of the interior of which they ramify, so that air laden with odoriferous particles can affect the nerves when it is drawn into or through the nasal passages. In man the sense of smell is very feeble and imperfect in comparison with that of many animals, especially of the carnivores, which pursue their prey by scent, and ruminants, which escape their enemies by the same means. Smell in the lower animals seems to be the guiding sense in determining their choice of food.

Memory, imagination, old sentiments and associations, are more readily reached through the sense of *smell* than by almost any other channel. *O. W. Holmes*, Autocrat, iv.

Smell is a sensation excited by the contact with the olfactory region of certain substances, usually in a gaseous condition and necessarily in a state of fine subdivision.

3. A faint impression; a subtle suggestion; a hint; a trace: as, the poem has a *smell* of the woods.—4. An act of smelling: as, he took a *smell* at the bottle. = *Syn.* *Smell*, *Scent*, *Odor*, *Savor*, *Perfume*, *Fragrance*, *Aroma*, *Stench*, *Stink*. *Smell* and *scent* express the physical sense, the exercise of the sense, and the thing which appeals to the sense. The others have only the last of these three meanings. Of the nine words the first four may express that which is pleasant or unpleasant, the next three only that which is pleasant, the last two only that which is very unpleasant. *Smell* is the general word; the others are species under it. *Scent* is the smell that proceeds naturally from something that has life: as, the *scent* of game; the *scent* of the tea-rose. *Odor* is little more than a Latin substitute for *smell*: as, the *odor* of musk, of decaying vegetation; it may be a dainty word, as *smell* cannot be. *Savor* is a distinctive smell, suggesting taste or flavor, proceeding especially from some article of food: as, the *savor* of garlic. *Perfume* is generally a strong or rich but agreeable smell. *Fragrance* is best used to express fresh, delicate, and delicious odors, especially such as emanate from living things: as, the *fragrance* of the violet, of new-mown hay, of the breath of an infant. *Aroma* should be restricted to a somewhat spicy smell: as, the *aroma* of roasted coffee, or of the musk-rose. *Stench* and *stink* are historically the same word, in different de-

grees of strength, representing a strong, penetrating, and disgusting odor; *stink* is not for polite use.

Connection with *melt* is doubtful.] **I. trans.** To fuse; melt; specifically, to treat (ore) in the large way, and chiefly in a furnace or by the aid of heat, for the purpose of separating the contained metal. Metallurgical operations carried on in the moist way, as the amalgamation of gold and silver ores in pans, treatment by lixiviation, etc., are not generally designated by the term *smelting*. Establishments where this is done are more commonly called mills or reduction-works, and those in which iron is smelted are usually designated as blast-furnaces or iron-furnaces. The vari-

ous smelting operations differ greatly from each other, according to the nature of the combinations operated on. Simple ores, like galena, require only a very simple series of operations, which are essentially continuous in one and the same furnace; more complicated combinations, like the mixtures of various cupiferous ores smelted at Swansea by the English method, require several successive operations, entirely disconnected from each other, and performed in different furnaces. In the most general way, the essential order of succession of the various processes by which the sulphureted ores (and most ores are sulphureted) are treated is as follows: (1) calcination or roasting, to oxidize and get rid (as far as possible) of the sulphur; (2) reduction of the metal contained in the oxidized combinations obtained; (3) refining, or getting rid of the last traces of deleterious metals associated in the ores with the useful metal, to obtain which is the essential object of the operation.

II. *intrans.* To fuse; melt; dissolve.

Mortimer, Husbandry.

smelt² (smelt), *n.* [*< ME. smelt, < AS. smelt = Norw. smelta = Dan. smelt, a smelt (applied to various small fishes); perhaps so called because it was 'smooth'; cf. AS. smelt, smilt, serene, smooth (as the sea); see smelt¹.] 1. Any one of various small fishes. (a) A small fish of the family *Argentinidae* and the genus *Osmerus*. The common European smelt is the spirling, *O. eperlanus*; it becomes about 10 to 12 inches long, and is of an olive-green above and a silvery white below, with a silver longitudinal lateral band. It exhales when fresh a peculiar scent suggesting the cucumber. This fish is prized as a delicacy. The corresponding American smelt is *O. mordax*, of the Atlantic*

coast from Virginia northward, anadromous to some extent, and otherwise very similar to the spirling. There are several true smelts of the Pacific coast of North America, as *O. thaleichthys*, the Californian smelt, and *O. dentex*, the Alaska smelt. Hence—(b) Any other species of the family *Argentinidae* related to the smelt, such as the *Hypomesus pretiosus* or *olitus*, also called *surf smelt*, which is distinguished from the true smelt by having the dorsal mostly advanced beyond the ventrals and by the much smaller mouth and weak teeth. It inhabits the Pacific coast of the United States from California northward, reaches a length of about 12 inches, and is highly esteemed as a food-fish. (c) In California, any species of the family *Atherinidae*, resembling the true smelt in general appearance, but provided with an anterior spinous and a posterior branched dorsal fin, and having the ventrals not far behind the pectorals. The common Californian smelt, *Atherinopsis californiensis*, reaches a length of about 15 inches, and its flesh is fine, firm, and of excellent flavor, though a little dry. It is one of the most important food-fishes of California, never absent from the markets. Other species are *Atherinops affinis*, the little smelt, and *Leuresthes tenuis*. (d) A fresh water cyprinoid, *Hybomphalus regius*, which somewhat resembles the true smelt in form, translucency, and color; also, one of other cyprinoids, as the spawn-eater and the silversides. To apply smoke to; blacken with smoke; hang in smoke; mediate or dry by smoke; fumigate: as, to *smoke* infected clothing; to subject to the action of smoke, as meat; cure by means of smoke; smoke-dry; also, to incense. Smoking meat consists in exposing meat previously salted, or rubbed over with salt, to wood-smoke in an apartment so distant from the fire as not to be unduly heated by it, the smoke being admitted by flues at the bottom of the side walls. Here the meat absorbs the empyreumatic acid of the smoke, and is dried at the same time. The kind of wood used affects the quality and taste of the meat, smoke from beech and oak being preferable to that from fir and larch. Smoke from the twigs and berries of juniper, or from rosemary, peppermint, etc., imparts somewhat of the aromatic flavor of these plants. A slow smoking with a slender fire is better than a quick and hot one, as it allows the empyreumatic principles time to penetrate into the interior without over-drying the outside.

3. A fungous disease of plants, affecting especially the cereal plants, to many of which it is exceedingly destructive. It is caused by fungi of the family *Ustilaginaceæ*. The stinking smut is caused by two species of fungus, which differ only in microscopic characters—*Tilletia tritici*, with rough spores, and *T. foetens*, with smooth spores. It is the most destructive disease of wheat known, not infrequently causing the loss of half of the crop or more. It occurs to some extent throughout all the wheat-growing regions, but is especially common in Indiana, Iowa, and adjacent States, as well as in California and Europe. The disease does not spread from plant to plant or from field to field, but the infection takes place at the time the seed sprouts. No remedy can be applied after the grain is sown, but the disease can be prevented by sowing clean seed in clean soil and covering well. Smutty seed can be purified by wetting thoroughly with a solution of blue vitriol, using one pound or more to a gallon of water. Black smut may be similarly treated. *U. (a) Some or any bird belonging to the family *Sceloporidae*, having the bill straight, much longer than the head dilated and sensitive at the end, and with a median lengthwise groove on the upper mandible near the end; the toes cleft to the base, the primaries not emarginate and the tail-feathers barred; especially, a member of the genus *Gallinago* (*Sceloporus*, being restricted to certain wood-cocks). In Great Britain three species of *Gallinago* are called *snipe*. (1) The common snipe, or whole snipe, is *Gallinago vulgaris* or *G. media*, formerly *Sceloporus gallinago*. The fore neck and breast are light-brown speckled with dark-brown; and the belly is white. (See cut under *Gallinago*.) Snipe-like these, and of the same genus, are found in most countries, and are called by the same name, with or without a qualifying term. (b) Some other *sceloporidae* or snipe-like bird. There are very many such birds, chiefly distinguished from sandpipers (see *sandpiper*) by the length, from tatters or gambels by the sensitiveness, and from curlews, godwits, etc., by the straightness of the bill. (1) In the United States the gray-backed or red-breasted snipes are birds of the genus *Macrorhamphus*, of which there are 2 species or varieties, the lesser and greater longback, *M. griseus* and *M. scolopaceus*. they present uncounted varieties of very beautiful figures. The whiteness of snow is due primarily to the large number of reflecting surfaces arising from the minuteness of the crystals. When sufficient pressure is applied, the slightly adhering crystals are brought into

molecular contact, and the snow, losing its white color, assumes the form of ice. This change takes place when snow is gradually transformed into the ice of a glacier. Precipitation takes the form of snow when the temperature of the air at the earth's surface is near or below the freezing-point, and the flakes are larger the moister the air and the higher its temperature. The annual depth of snowfall and the number of days on which the ground is covered with snow are important elements of climate. In a ship's log-book abbreviated *s.*

snow-line (snô'lin), *n.* The limit of continual snow, or the line above which a mountain is continually covered with snow. The snow-line is due primarily to the decrease of the temperature of the atmosphere with increase of altitude. In general, the height of the snow-line diminishes as we proceed from the equator toward the poles; but there are many exceptions, since the position of the snow-line depends not only upon the mean temperature, but upon the extreme heat of summer, the total annual snowfall, the prevalent winds, the topography, etc. For these reasons, the snow-line is not only at different heights in the same latitude, but its position is subject to oscillation from year to year in the same locality. Long secular oscillations in the height of the snow-line are evidence of corresponding oscillations of climate. In the Alps the snow-line is at an altitude of 8,000 to 9,000 feet; in the Andes, at the equator, it is nearly 16,000 feet.

Between the glacier below the ice-fall and the plateau above it there must exist a line where the quantity of snow which falls is exactly equal to the quantity annually melted. This is the *snow-line*.

A modification of the latter is adapted to street-railroads. The snow-plow for ordinary country roads usually consists of a frame of boards braced together so as to form an acute angle in

front, and spread out behind to any required distance. The machine being drawn by horses harnessed to the center framework, the angular point enters the snow.

character of the country, the amount of snowfall, the tendency to drift, etc. Such plows vary in size from the simple plows carried on the front of an engine, resembling a cowcatcher with smooth iron sides, to heavy structures mounted on freight-car trucks, and pushed before one locomotive or more, or, as sometimes made, self-propelling. In recent forms the principle of centrifugal force has been utilized for removal of the snow. Snow-plows are often of great size, sometimes weighing fifty tons, and can be forced through very deep drifts.

snow-shoe (snô'shō), *n.* A contrivance attached to the foot to enable the wearer to walk on deep snow without sinking to the extent of being disabled. There are two principal kinds—the web or Canadian, and the long or Norwegian. The Canadian is a contracted oval in front and pointed behind, and is from 3 to 5 feet long and from 1 to 2 feet wide, the foot being fastened on the widest part of the shoe by means of thongs and so as to leave the heel free. It has a light rim of tough wood, on which is woven from side to side a web of rawhide. The Norwegian is merely a thin board, about 8 feet long and 3 inches wide, slightly curved upward in front; it is especially adapted to mountains, in descending which by its use great speed is attained. See *shoe*.

The game is simply one of dexterity and strength. The forefinger is placed in the basal notch, the thumb and remaining fingers reaching along the shaft, and the snow-snake is thrown forward on the ice or hard snow. . . . When the slender shaft is thrown, it glides rapidly over the surface, with upraised head and a quivering motion, that gives it a strange resemblance to a living creature. . . . The game is to see which person or side can throw it farthest, and sometimes the distance of a quarter of a mile is reached under favorable circumstances, but I think this rare.

It is made by grinding, in mortars or mills, the chopped leaves and stalks of tobacco in which fermentation has been induced by moisture and warmth. The tobacco is well dried previous to grinding, and this is carried sometimes so far as to give the peculiar flavor of the high dried snuffs, such as the Irish, Welsh, and Scotch. Some varieties, as the rappers, are moist. The admixture of different flavoring agents and delicate scents has given rise to fanciful names for snuffs, which, the flavor excepted, are identical. Dry snuffs are often adulterated with quicklime, and the moist kinds with ammonia, hellebore, pearl-ash, etc.

A chemical compound in common domestic use for washing and cleansing, made by the union of certain fatty acids with a salifiable base. Fats and fixed oils consist of fatty acids combined with glycerin. On treating them with a strong base, like potash or soda, glycerin is set free, and the fatty acid combines with the strong base and forms a soap. Soap is of two kinds—*soluble* soap, in which the base is potash, soda, or ammonia, and *insoluble* soap, whose base is an earth or a metallic oxide. Only the soluble soaps dissolve readily in water and have detergent qualities. Insoluble soaps are used only in pharmacy for liniments or plasters. Of the fats, stearates make the hardest, oleates the softest soaps; and of the bases, soda makes the hardest and least soluble, and potash the softest and most soluble. Perfumes are occasionally added, or various coloring matters are stirred in while the soap is semi-fluid. White soaps are generally made of olive-oil and soda. Common household soaps are made chiefly of soda and tallow. Yellow soap is composed of tallow, rosin, and soda, to which some palm-oil is occasionally added. (See *rosin-soap*.) Mottled soap is made by simply adding mineral and other colors during the manufacture of ordinary hard soap. Marine soap, known as *salt-water soap*, which has the property of dissolving as well in salt water as in fresh, is made of palm or cocoanut-oil and soda. Soft soaps are made with potash, instead of soda, and whale, seal, or olive-oil, or the oils of linseed, hemp-seed, rape-seed, etc., with the addition of a little tallow. Excellent soaps are made from palm oil and soda. A solution of soap in alcohol, with camphor and a little essential oil added to scent it, forms a soft ointment called *opodeldœ*, now superseded by soap-liniment, a similar preparation, which is liquid. Medicinal soap, when pure, is prepared from caustic soda and either olive- or almond-oil. It is chiefly employed to form pills of a gently aperient action. 2. A kind of pomade for coloring the hair. [Only as a translation of the Latin.]—3. Smooth words; persuasion; flattery: more often called *soft soap*. [Slang.]

soapberry (sôp'ber i), *n.*; *pl. soapberries* (-iz). The fruit of one of several species of *Sapindus*;

also, any of the trees producing it, and, by extension, any member of the genus. The fruit of the proper soapberries so abounds in saponin as to serve the purpose of soap. That of *S. saponaria*, a small tree of South America, the West Indies, and Florida, is much used in the West Indies for cleansing linen, etc., and is said to be extremely efficacious, though with frequent use deleterious to the fabric. Its roots also contain saponin. Its hard black seeds are made up into rosaries and necklaces, and sometimes have been used as buttons. In the East Indies the fruit of *S. trifoliatum* appears to have been used as a detergent from remote times. The pulp is regarded also as astringent, antiehmie, and tonic, and the seeds yield a medicinal oil. The wood is made into combs and other small articles. This species is sometimes called *Indian filbert*, translating the Mohammedan name, *S. (Dithlasma) Larak*, of Cochinchina, etc., has also a detergent property. The wood of *S. acuminatus* (*S. aspidioides*), of the southern United States, etc., is hard and strong, easily split into strips, and in the southwest much used for making cotton-baskets and the frames of pack-saddles. Its berries are reddish-brown, of the size of a cherry, with a soapy pulp. Also called *wild china-tree* (which see, under *china-tree*). The fruit of some species yields an edible pulp, though the seed is poisonous. Another name, especially of *S. trifoliatum*, is *soapnut*.

1. To mount on wings, or as on wings, through the air; fly aloft, as a bird or other winged creature; specifically, to rise and remain on the wing without visible movements of the pinions. The specific mode of flight is specially distinguished from any one in which the wings are flapped to beat the air; but the term *soaring* is also loosely applied to any light, easy flight to a great height with little advance in any other direction, whatever be the action of the wings, as of a skylark rising nearly vertically from the ground. In the case of heavy-bodied, short-winged birds which fly up thus, the action is often specified as *rocketing* or *towering* (see these verbs). A kind of swift wayward soaring, as of

the swallow, is often called *skimming*. Soaring specifically so called, or sailing on the air, is best shown in the flight of long-winged birds, whether their wings be either narrow and sharp, or ample and blunt, as the albatross, frigate, and some other sea-birds, storks, cranes, and some other large waders, turkey-buzzards and other vultures, eagles, kites, and some other large birds of prey. It is capable of being indefinitely protracted, either on a horizontal plane, or at a considerable inclination upward, at least in some cases; but most birds which soar to a higher level without beating the wings take a spiral course, mounting as much as they can on that part of each lap which is against the wind, and this action is usually specified as *gyrating* or *circling*.

So have I seen a lark rising from his bed of grass, and soaring upwards, singing as he rises, and hopes to get to heaven, and climb above the clouds.

J. Taylor, *Sermon*, *The Return of Prayers*, ii.

For the present its members content themselves with the promotion of measures for the amelioration of the condition of the working classes, such as shortening the hours of labor, forbidding the employment of children in factories, and higher education for all. Social Democrats are now found in many of the countries of Europe, as well as in the United States. Since the fusion of the Lassalle and Marx groups of socialists in 1875, the social-democratic party in Germany has had remarkable development.—**Social dynamics**, that branch of sociology which treats of the conditions of the progress of society from one epoch to another. socialism (sō'shiā-lizm), *n.* [= *F.* *socialisme* = *Sp.* *Pg.* *socialismo* = *G.* *socialismus*; as *social* + *-ism*.] Any theory or system of social organization which would abolish, entirely or in great part, the individual effort and competition on which modern society rests, and substitute for it cooperative action, would introduce a more perfect and equal distribution of the products of labor, and would make land and capital, as the instruments and means of production, the joint possession of the members of the community. The name is used to include a great variety of social theories and reforms which have more or less of this character.

What is characteristic of *socialism* is the joint ownership by all the members of the community of the instruments and means of production; which carries with it the consequence that the division of the produce among the body of owners must be a public act performed according to rules laid down by the community. *Socialism* by no means excludes private ownership of articles of consumption. *J. S. Mill*, *Socialism*.

Socialism, . . . while it may admit the state's right of property over against another state, does away with all ownership, on the part of members of the state, of things that do not perish in the using, or of their own labor in creating material products.

Woolsey, *Communism and Socialism*, p. 7.

Christian socialism, a doctrine of somewhat socialistic tendency which sprang up in England about 1850, and flourished under the leadership of Charles Kingsley, Frederick D. Maurice, Thomas Hughes, and others. The main contentions of its advocates were (1) that Christianity should be directly applied to the ordinary business of life, and that in view of this the present system of competition should give place to cooperative associations both productive and distributive, where all might work together as brothers; (2) that any other change of the laborer's life, as aimed at in most socialistic schemes, would not suffice to settle the labor question, but that there must be an inner change brought about by education and elevation of character, especially through Christianity; and (3) that the aid of the state should not be invoked further than to remove all hostile legislation. A similar scheme appeared somewhat earlier in France. The doctrines of Christian socialism, or similar doctrines under the same name, have been frequently advocated in the United States.—**Professorial socialism**. Same as *socialism of the chair*.—**Socialism of the chair**, a name (first used in ridicule in 1872 by Oppenheim, one of the leaders of the National Liberals) for the doctrines of a school of political economy in Germany which repudiated the principle of laissez-faire, adopted in the study of political economy the historical method (which see, under *historical*), and strove to secure the aid of the state in bringing about a better distribution of the products of labor and capital, especially to bring to the laborer a larger share of this product, and to elevate his condition by means of factory acts, savings-banks, sanitary measures, shortening of the hours of labor, etc.

The term is in theological usage a general one, and includes a considerable variety of opinion. The Socinians believe that Christ was a man, miraculously conceived and divinely endowed, and thus entitled to honor and reverence, but not to divine worship; that the object of his death was to perfect and complete his example and to prepare the way for his resurrection, the necessary historical basis of Christianity; that baptism is a declarative rite merely, and the Lord's Supper merely commemorative; that divine grace is general and exerted through the means of grace, not special and personally efficacious; that the Holy Spirit is not a distinct person, but the divine energy; that the authority of Scripture is subordinate to that of the reason; that the soul is pure by nature, though contaminated by evil example and teaching from a very early age; and that salvation consists in accepting Christ's teaching and following his example. The Socinians thus occupy theologically a midway position between the Arians, who maintain the divinity of Jesus Christ, but deny that he is coequal with the Father, and the Humanitarians, who deny his supernatural character altogether.

Socratic (sō-krat'ik), *a.* and *n.* [= *F. Socratique* = *Sp. Socrático*] = *Pg. It. Socratico*, < *L. Socraticus*, < *Gr. Σωκρατικός*, of or pertaining to Socrates, < *Σωκράτης*, Socrates.] 1. *a.* Of or pertaining to the methods, style, doctrine, character, person, or followers of the illustrious Athenian philosopher Socrates (about 470–399 B. C.).

His father, Sophroniscus, was a sculptor, and he was brought up to the same profession. His mother, Phædrate, was a midwife. Socrates was unjustly accused before the council of the prytanes of being a corrupter of youth and of not believing in the gods of the city, was condemned, and died by drinking hemlock. His philosophy is known to us by the account of Xenophon, written to show the practical upshot of his teachings and the injustice of his sentence, and by the Dialogues of Plato, in most of which Socrates is introduced only to give an artistic setting to Plato's own discussions. Some things can also be inferred from fragments of Æschines, and from the doctrines of other companions of Socrates. He wrote nothing, but went about Athens frequenting some of the best houses, and followed by a train of wealthy young men, frequently cross-questioning those teachers whose influence he distrusted. He himself did not profess to be capable of teaching anything, except consciousness of ignorance; and he bargained for no pay, though he no doubt took moderate presents. He called his method of discussion (the *Socratic method*) *obstetric* (see *midwifery*), because it was an art of inducing his interlocutors to develop their own ideas under a catechetical system. He put the pretensions to shame by the practice of *Socratic irony*, which consisted in sincerely acknowledging his own defective knowledge and professing his earnest desire to learn, while covertly admitting the pretensions of the person interrogated, and in persisting in this attitude until examination made it appear bitter sarcasm. He was opposed to the rhetorical teaching of the sophists, and had neither interest nor confidence in the physical speculations of his time. The center of his philosophy, as of all those which sprang directly or indirectly from his—that is to say, of all European philosophy down to the rise of modern science—was morality. He held that virtue was a species of knowledge; really to know the right and not to do it was impossible, hence wrong-doers ought not to be punished; virtue was knowledge of the truly useful. He was far, however, from regarding pleasure as the ultimate good, declaring that if anything was good in itself, he neither knew it nor wished to know it. The great problems he held to consist in forming general conceptions of the nature of truth, happiness, virtue and the virtues, friendships, the soul, a ruler, a suit of armor—in short, of all objects of interest. These conceptions were embodied in definitions, and these definitions were framed by means of analytic reflection upon special instances concerning which all the world were agreed. He would not allow that anything was known for certain concerning which competent minds opined differently. This process of generalization, the *Socratic induction*, together with the doctrine of the necessity of definitions, were his two contributions to logic. The disciples of Socrates were Plato, Euclides, Phædo, Antisthenes, Aristippus, Xenophon, Æschines, Simonias, Cebes, and about twenty more. Properly speaking, there was no Socratic school; but the Academy and the Megarian, Eleatic, Eretrian, Cynic, and Cyrenaic schools are called *Socratic*, as having been founded by immediate disciples of Socrates.—*Socratic school*. See *school*, 2.

soda (sō'dā), *n.* [= *F. Sp. Pg. D. G. Sw. Dan. soda* (NL. *soda*), < *It. soda*, *soda*, *OHt. soda* (= *OE. souldc*), saltwort, glasswort, fem. of *sodo*, contr. of *solido*, solid, hard: see *solid*.] 1. Sesquicarbonate or normal carbonate of sodium (Na_2CO_3); soda-ash: the latter being the common name of the commercial article, one of the most, if not the most, important of all the products of chemical manufacture. Various hydrated carbonates of sodium occur in nature—the decahydrate or natron; the monohydrate, known as *thermonatrite*; and trona, a compound of the sesquicarbonate and the bicarbonate with three equivalents of water. These natural carbonates occur in solution in the water of various alkaline lakes, or as deposits at the bottoms of such as have become dried up, but usually mixed with more or less common salt, sodium sulphate, and other saline combinations. It was from these deposits, and from the incineration of various plants growing by the sea-shore (*Salada*, *Salicornia*, *Chenopodium*, *Statice*, *Reaumuria*, *Nitraria*, *Tetragonia*, *Mesembryanthemum*), that soda was formerly obtained. These sources have become of little importance since artificial soda began to be made from common salt, a process invented by Leblanc, and put in operation near Paris toward the end of the eighteenth century. By this process common salt is decomposed by sulphuric acid, and the resulting sodium sulphate is mixed with limestone and coal, and heated in a reverberatory furnace, the product (technically known as *black ash*) consisting essentially of soluble sodium carbonate and insoluble calcium sulphide, which are easily separated from each other by lixiviation. By the Leblanc process the soda used in the arts was almost exclusively produced until about thirty years ago, when the so-called ammonia or Solvay process began to become of importance. This process had been patented in England as early as 1828, and tried there and near Paris, but without success. The difficulties were first overcome by E. Solvay, who in 1861 established a manufactory of soda by this process (since known by his name) near Brussels. By the ammonia or Solvay process a concentrated solution of common salt is saturated with ammonia, and then decomposed by carbonic acid. By this means sodium chlorid is converted into sodium carbonate, and the ammonia is afterward recovered by the aid of lime or magnesia. This process has within the past few years become of great importance, and at the present time about half the soda consumed in the world is made by it. Whether it will eventually entirely supplant the Leblanc process cannot yet be stated. The chief advantage which it presents is that the amount of coal consumed by it is much smaller than that required by the older process, so that countries where fuel is not very cheap and abundant can now make their own soda, being no longer dependent on England, as they were in large degree before the Solvay process became successful. For the properties of pure soda, see *sodium carbonate*, under *sodium*. Also called *mineral alkali*.

It was first isolated by Davy, in 1807, by electrolysis, and is at present obtained on a large scale by igniting sodium carbonate with charcoal. Sodium is a silver-white metal with a high luster, but it oxidizes rapidly on exposure to moist air. Heated in the air, it burns rapidly with a bright-yellow flame, very characteristic of the metal; thrown into cold water, it oxidizes, but does not become hot enough to set the evolved hydrogen on fire, as potassium does; with hot water, ignition of the hydrogen takes place. Its specific gravity at 50° is 0.9735; at the ordinary temperature it has the consistency of wax; at 204° it melts, and forms a liquid resembling mercury in appearance. Next to silver, copper, and gold, it is, of the metals, the best conductor of heat and electricity; next to cesium, rubidium, and potassium, it is the most electropositive of the metals. It is extensively used in the laboratory as a powerful reducing agent; it is closely analogous to potassium in its chemical relations. Two of its compounds are very widely diffused in nature, and of the highest importance from various points of view; these are common salt and sodium carbonate, or soda.—**Sodium bicarbonate**, a compound having the formula *NaHCO₃*. It is a white crystalline powder, with a weaker alkaline taste than the other carbonate described below, and less soluble in water. Also called *soda saleratus*.—**Sodium borate**. See *borax*. **Sodium carbonate**, a compound having the formula *Na₂CO₃*, either anhydrous or containing water of crystallization. (The method of manufacture is described under *soda*.) Anhydrous sodium carbonate, or chemically pure soda, is a white powder having an alkaline taste and reaction, readily soluble in water with evolution of heat. It fuses at a dull red heat to a clear liquid. It is used in enormous quantities in the arts for a great variety of purposes. When crystallized from aqueous solution it forms transparent crystals, called *washing-crystals*, which contain ten equivalents of water. These effloresce on exposure to air.—**Sodium chlorid**, common salt, *NaCl*.

Solanaceæ (*sol-ā-nā'sē-ē*), *n. pl.* [*NL.* (Bartling, 1830), < *Solanum* + *-acæ*.] An order of gamopetalous plants, of the series *Bicarpellatæ* and cohort *Polemoniæ*, characterized by regular flowers commonly with a plicate border, carpels with many ovules, and a straight, spiral, or coiled embryo in fleshy albumen. The sepals, petals, and stamens are each usually five, the ovary usually entire and two-celled, with an undivided style. In its plicate corolla the order resembles the *Cucurbitaceæ*, which are, however, unlike it in their few-seeded carpels and usually twining habit. Its other nearest ally is the *Serpyllariæ*, to which the tribe *Salpiglossideæ*, by its didynamous stamens and somewhat irregular flowers, forms a direct transition. The order includes about 1,750 species, perhaps to be reduced to 1,500, classed in 72 genera of 5 tribes, for the types of which see *Solanum*, *Atropa*, *Hyoisuanus*, *Cestrum*, and *Salpiglossis*. They are erect or climbing herbs or shrubs, or sometimes trees, and either smooth or downy, but rarely with bristles. They bear alternate and entire toothed or dissected leaves, often in scattered unequal pairs, but never truly opposite. The typical inflorescence is a bractless cyme, either terminal, opposite the leaves, or lateral, but not truly axillary, and sometimes converted into umbels or sessile clusters or reduced to a single flower. They are usually rank-scented and possess strongly narcotic properties, either throughout or in special organs, in *Mandevilla* in the root, in most others strongly developed in the leaves, as in belladonna, tobacco, henbane, stramonium, and nightshade. In some, as the henbane, this principle is actively developed for a limited time only; in others, parts from which it is absent furnish a valued food, as the potato, tomato, and egg-plant, or a condiment, as Cayenne pepper. The order furnishes also several tonics and numerous diuretic remedies, as species of *Physalis*, *Nicotiana*, *Cestrum*, and *Solanum*. Plants of this order are widely dispersed through warm climates of both hemispheres, extending beyond the tropics in North and South America, especially in the west, but less frequent in Europe and Asia. They are absent in alpine and arctic regions and in Australia. About 17 genera and 55 species are natives of the United States, chiefly in the southwest, and largely of the genera *Leptocarpum*, *Solanum*, and *Physalis*. For other important genera, see *Lycopersicon*, *Capsicum*, *Datura*, *Nicotiana*, *Petunia*, and *Solanandra*.

solander² (*sō-lan'dər*), *n.* [*< Solandra* (see quot. and *Solandra*).] A form of box designed to contain prints or drawings. See the quotation.

A *Solander* case is the invention of Dr. Solander, of memory dear to readers of "Cook's Voyages," who used one to contain and preserve specimens for natural history, drawings, and matters of the kind. It is really a box, generally shaped like a book, one side of which, turning on hinges, serves for a lid, while the front, or fore-edge of the case, is furnished with hinges to be let down, so that the fronts as well as the tops of the contents can be got at.

Solandra (*sō-lan'drī*), *n.* [*NL.* (Swartz, 1787, named after Daniel Solander (born 1736, died about 1781), a Swedish botanist and traveler.)

A genus of solanaceous plants, of the tribe *Atropææ*. It is characterized by solitary flowers with a long calyx-tube, an obliquely funnel-shaped corolla with broad imbricated lobes and imbricate sinuses, five stamens, and a two-celled ovary imperfectly four-celled by false partitions, forming in fruit a pulpy berry half-protruded from the torn membranous calyx. The 4 species are all American and tropical. They are lofty climbing

coarse shrubby plants, with entire smooth fleshy and coriaceous shining leaves, clustered near the ends of the branches, and very large terminal white, yellowish, or greenish flowers on fleshy pedicels. *S. grandiflora*, *S. luciflora*, and other species are sometimes cultivated from the West Indies under the name *trumpet-flower*, forming handsome greenhouse evergreens, usually grown as climbers, or, in *S. luciflora*, as small shrubs.

Solanææ (*sō-lā-nē-ē*), *n. pl.* [*NL.* (A. L. de Jussieu, 1789), < *Solanum* + *-ææ*.] A tribe of plants of the order *Solanaceæ*. It is distinguished by flowers with the corolla somewhat equally plicate or divided into valvate or imbricate lobes, and having perfect stamens and a two-celled ovary which becomes an indehiscent berry in fruit, containing compressed seeds with a curved embryo and slender seed-leaves not broader than the radicle. It includes 31 genera, very largely natives of South America. For some of the most important, see *Solanum* (the type), *Capsicum*, *Lycopersicon*, and *Physalis*.

solanæous (*sō-lā-nē-ūs*), *a.* Belonging to the *Solanaceæ*, or especially to *Solanum*.

solanine (*sol'ā-nin*), *n.* [*NL.* < *Solanum* + *-in*.] A complex body, either itself an alkaloid or containing an alkaloid, the active principle of bitter-sweet, *Solanum Dulcamara*. It is a narcotic poison.

solano (*sō-lā-nō*), *n.* [*< Sp. solano*, an easterly wind (cf. *solanazo*, a hot, violent easterly wind, *solan*, a sunny place), < *L. solanus* (see *ventus*), the east wind (usually called *subsolanus*), < *sol*, sun; see *sol*, *solar*.] The Spanish name of an easterly wind.

solanoid (*sol'ā-noid*), *a.* [*< NL. Solanum* + *Gr. eidos*, form.] Resembling a potato in texture; said of cancers.

Solanum (*sō-lā-nūm*), *n.* [*NL.* (Tournefort, 1700), < *L. solanus*, the nightshade.] A genus of gamopetalous plants, type of the order *Solanaceæ*, the nightshade family, and tribe *Solanææ*. It is characterized by flowers usually with a deeply five- or ten-lobed spreading calyx, an angled or five-lobed wheel-shaped corolla, very short filaments with long anthers which form a cone or cylinder, open by a vertical pore or a larger chink, and are almost destitute of any connective, and a generally two-celled ovary with its conspicuous placenta projecting from the partition. It is one of the largest genera of plants (compare *Senecio*), and includes over 950 published species, of which perhaps 750 are distinct. Their distribution is similar to that of the order, and they constitute half or two-thirds of its species. They are herbs, shrubs, or small trees, some true climbers, of polymorphous habit, either smooth, downy, or woody, or even viscid. They bear alternate entire or divided leaves, sometimes in pairs, but never truly opposite. Their flowers are yellow, white, violet, or purplish, grouped in panicles or umbel-like cymes, which are usually scirpoid, sometimes apparently racemose, rarely reduced to a single flower. The species form two groups, the subgenera *Pachystemonium* and *Leptostemonium* (Dunal 1813), the first unarmed and with broad anthers, the other with long anthers opening by minute pores, and commonly armed with straight spines on the branchlets, leaves, and calyx. South America is the central home of the genus, and of its most useful member the potato, *S. tuberosum*, which occurs in numerous wild varieties, with or without small tubers on the root-tubers, from Lima to latitude 45 S. in Patagonia, and northward to New Mexico. (See *potato*, *potato*, and cut under *potato* and *tuber*.) There are 15 native species in the United States, chiefly in the southwest, besides numerous prominent varieties and 5 introduced species. The seeds of many species are remarkably tenacious of life, and are therefore soon naturalized, especially the cosmopolitan *S. nigrum*, the common or black nightshade, the original type of the genus (for which see *nightshade*, and figure of leaf under *repand*; and compare *cutting of pepper buds*, under *ointment*); from this the name *nightshade*

is sometimes extended to several other European species. For *S. Dolomieuana*, the bitter-sweet, the other common species of the northeastern United States, a climber introduced for ornament, see *nightshade*, *folenwort*, *dulcamara*, and *dolanmaria*. Two others in the United States are of importance as prickly weeds, *S. Carolinense* (for which see *horse-nettle*), a pest which has sometimes caused fields in Delaware to be abandoned, and *S. rostratum* (for which see *sand-bark*), of abundant growth on the plains beyond the Mississippi, and known as the chief food of the Colorado beetle or potato-bug before the introduction of the potato westward. The genus is one of strongly marked properties. A few species with comparatively inert foliage have been used as salads, as *S. nigriflorum* in the West Indies and *S. sessiliflorum* in Brazil; but the leaves of most, as of the common potato, bitter-sweet, and nightshade, are more or less powerfully narcotic. (See *solanine*.) The roots, leaves, seeds, and fruit-juices yield numerous remedies of the tropics: *S. jubaatum* is strongly sudorific; *S. pseudopurpureum* is a source of quina in Brazil, a powerful bitter and febrifuge; others are purgative or diuretic, as *S. paniculatum*, the jernleba of Brazil; *S. stramonifolium* is used as a poison in Cayenne. The berries are often edible, as in the well-known *S. Melongena* (*S. esculentum*) (for which see *egg-plant*, *brinjal*, and *aubergine*). Others with edible fruit are *S. aviculare* (see *kawarow-apple*), *S. Uppia*, the cannibal-apple or borolima of the Fiji and other Pacific islands, with large red fruit used like the tomato, *S. roseum* the gungyang of southeastern Australia, *S. alatum* and *S. Ethiopieum*, cultivated in China and southern Asia, *S. Gilo* in tropical America, *S. muricatum*, the pepino or melon-pear of Peru, and *S. racemosum* in the West Indies. *S. Quilense*, the Quito orange, yields a fruit resembling a small orange in color, fragrance, and taste. *S. Indicum* (*S. Anacardium*) is known as *Madagascar potato*, and *S. crispum* of Chili as *potato-tree*. Some species bear an inedible fruit, as *S. mammosum*, the macaw-bush (which see), also called *gusmber* and (together with *S. toruam*) *turkey-berry*. For *S. Bahamense*, see *caneberry*, and for *S. Solanaceum*, see *Solanum-apple*. Other species yield dyes, as *S. anaphaloides* in Peru and *S. Vespertilio* in the Canaries, used to paint the face; *S. Guianense*, used to dye silk violet; and *S. indigoferum*, in cultivation in Brazil for indigo. *S. marginatum* is used in Abyssinia to tan leather; and the fruit of *S. saponaceum* is used as soap in Peru. Several species have been long cultivated as ornaments for their abundant red or orange berries, as *S. Pseudo-capsicum*, the Jerusalem cherry or winter-cherry (see *cherry*), and the Brazilian *S. Capsicastrum*, the dwarf winter-cherry or star-capsicum. Many others are now cultivated as ornamental plants, and are known by the generic name *Solanum*, as *S. Karstii*, from Venezuela, with violet flowers; *S. betaceum*, a small pink-flowered fleshy South American tree with fine scarlet egg-like fruit; and *S. lanceolatum*, with narrow willow-like leaves, reputed the most showy blooming species. Others are cultivated for their conspicuous foliage, as *S. crinitum* and *S. macranthum*, with leaves 2½ feet long; *S. robustum*, clad in showy red down; and *S. Warsceviczii*, with handsome flowers and large leaves elegantly cut. The climber *S. jasminoides*, the jasmine-solanum, is a house-plant from Brazil, esteemed for its large and abundant clusters of fragrant white or bluish flowers.

Solariidae (sō-lā-rī-i-dē), *n. pl.* [NL., < *Solarium* + *-idae*.] A family of pectinibranchiate gastropods, typified by the genus *Solarium*. The animal has the tentacles nearly united at the base; eyes on the upper part of the outer side of their base; the proboscis long, cylindrical, completely retractile; and the shell conical and generally declivous from the apex, with carinated margin of the last whorl, and a deep umbilical cavity, recalling a spiral staircase. The species inhabit tropical seas. They are rather large and generally handsome shells, some of which are common parlor ornaments. See *cut* under *Solarium*.

A fusible alloy used for joining or binding together metal surfaces or joints, as the edges of tin cans, jewelry, and kitchen utensils. Being melted on each surface, the solder, partly by chemical attraction and partly by cohesive force, binds them together. After cleaning the edges to be joined, the workman applies a solution of zinc in hydrochloric acid and also powdered rosin to the cleaned surfaces; then he touches the heated soldering-iron to the rosin, and holding the solder-bar and iron over the parts to be joined melts off little drops of solder at intervals along the margins, and runs all together with the hot iron. There are many of these alloys, as soft solder used for tinware, hard solder for brass and iron, gold solder, silver solder, spelter solder, plumbers' solder, etc. Every kind is used at its own melting point, which must always be lower than that of the metals to be united, soft solders being the most fusible.

compared to the form of a human sole; the dorsal and anal fins are very long, but free from the caudal, which has a rounded end, and pectorals are developed on both sides; the mouth is moderately decurved; the nostrils of the blind side are not dilated; and the height of the body is a little less than a third of the total length. The color is a dark brown, with a black spot at the end of the pectoral fin. This sole is common along the European coasts, and is one of the most esteemed of food-fishes. The flesh is white, firm, and of excellent flavor, especially when the fish has been taken in deep water. The average weight is about a pound, although the fish occasionally reaches a much larger size. It prefers sandy or gravelly shores, but retires into deep water when frost sets in. It feeds chiefly upon mollusks, but also on the eggs of fishes and other animals. It sometimes ascends into fresh water. There are other species, of several different genera, as *Achirus lineatus*, commonly called *hog-choker*. The name *sole* is also given to various species of the related family *Pleuronectidae*. Along the Californian coast the common sole is a pleuronectoid, *Lepidopsetta bilineata*, which reaches a length of about 20 inches and a weight of five or six pounds, although its average weight as seen in the markets is about three pounds. In San Francisco only about two per cent. of the flatfishes caught belong to this species, but along Puget Sound it constitutes about thirty per cent. of the catch. It feeds chiefly on crustaceans and small fishes, and is regarded as an excellent food-fish. Other *Pleuronectidae* called soles along the Pacific coast of North America are the *Parophrys retulus* and *Hippoglossoides jordani*. See also cuts under *Pleuronectidae* and *Solidae*.

The ends of the wire are brought to the middle point, and when a current is passed through the circuit the solenoid behaves, as far as external action is concerned, like a long and thin bar magnet. 3. An advocate; specifically, one who represents a party in a court of justice, particularly a court of equity. Generally, in the United States, wherever the distinction between courts of law and of equity remains, practitioners in the latter are termed *solicitors*. In England solicitors are officers of the supreme court and the medium between barristers and the general public; they prepare causes for the barrister, and have a right of audience as advocates before magistrates at petty sessions, at quarter-sessions where there is no bar, in county courts, and in the bankruptcy court, but they cannot appear as advocates in any of the superior courts, or at assizes, or at any court of commission. Solicitors were at one time officers only of the court of chancery, but the term is now applied to all attorneys. In Scotland solicitors are of two classes—solicitors in the supreme court, who occupy a position similar to that of solicitors in England; and solicitors at law, who are members of a society of law-agents at Edinburgh, incorporated by royal charter and entitled to practise before inferior courts; they are also known by the name of *procurators*. Law-agents of both kinds in Scotland are now on an equal footing. *Stater.*

=Syn. 1. Dense.—8. Stable, weighty, important.

II. n. 1. A body which throughout its mass (and not merely at its surface) resists for an indefinite time a sufficiently small force that tends to alter its equilibrium figure, always springing back into shape after the force is removed; a body possessing elasticity of figure. Every such body has limits of elasticity, and, if subjected to a strain exceeding these limits, it takes a set and does not return to its original shape on being let go. This property is called *plasticity*. The minimum energy required to give a set to a body of definite form and size measures its resilience. When the resilience of a body is small and masks its springiness, the body is called *soft*. Even fluids transmit shearing forces if time be allowed, and many substances will yield indefinitely to very small (but not indefinitely small) forces applied for great lengths of time. So solids that have received a small set will sometimes partially recover their figures after a long time. This property in fluids is called *viscosity*, in solids *after-effect* (German *nachwirkung*). The phenomenon is connected with a regrouping of the molecules, and indicates the essential difference between a solid and a liquid. In fluids diffusion is continually active, and in gases it produces phenomena of viscosity. In liquids it is not rapid enough to give rise to sensible viscosity, but the free motion of the molecules makes the body fluid, while the tendency of sets of molecules to continue for a while associated makes the fluidity imperfect. In solids, on the other hand (at least when not under strain), there is no diffusion, and the molecules are consequently in stationary motion or describing quasi-orbits. They thus become grouped in the mode in which they have least positional energy consistent with their kinetic energy. When this grouping is slightly disturbed, it tends to restore itself; but when the disturbance is greater, some of the molecules will tend to return to their old places and others to move on to new situations, and this may give rise to a new permanent grouping, and exhibit the phenomenon of plasticity. But if not quite sufficient for this, disturbances of the molecular motions somewhat similar to the secular perturbations of the planets will result, from which there will be no restoration for a very long time. Solid bodies are very strongly cohesive, showing that the molecules attract one another on the whole; and they are generally capable of crystallization, showing that the attractions of the molecules are different in different directions.

2. In *geom.*, a body or magnitude which has three dimensions—length, breadth, and thickness—being thus distinguished from a *surface*, which has but two dimensions, and from a *line*, which has but one. The boundaries of solids are surfaces. Besides the three round bodies (the sphere, cone, and cylinder), together with the conoids, and the pyramids, prisms, and prismatoids, the most important geometrical solids are the five Platonic and the Kepler-Poinsot regular polyhedra, the two semi-regular solids, and the thirteen Archimedean solids. The faces, edges, or summits of one solid are said to correspond with the faces, edges, or summits of another when the radii from the center of the for-

mer to the mid-faces, mid-edges, or summits can be simultaneously brought into coincidence with the radii from the center to the mid-faces, mid-edges, or summits of the latter. If two solids correspond faces to summits, summits to faces, and edges to edges, they are said to be *reciprocal*. If to the edges of one solid correspond the faces or summits of another, while to the faces and summits together of the former correspond the summits or faces of another, the latter is said to be the *summital* or *facial* holohedron of the former. The regular tetrahedron is the reciprocal of itself, and its reciprocal holohedron is the cube and octahedron. The reciprocal holohedra of these, again, are the semi-regular dodecahedron and the cuboctahedron. The facial holohedron of these, again, is the small rhombicuboctahedron. The faces of the truncated cube and truncated octahedron correspond to those of the cuboctahedron. The snub-cube has faces corresponding to the cuboctahedron, and twenty-four faces which in two sets of twelve correspond to the summits of two other cuboctahedra. The faces of the great rhombicuboctahedron correspond to those of the small rhombicuboctahedron. Just as the cube and octahedron are reciprocal, so likewise are the Platonic dodecahedron and icosahedron, though they are related to no hemihedral body like the tetrahedron. Their reciprocal holohedra are the semi-regular triacontahedron and the icosidodecahedron, and the facial holohedron of these, again, is the small rhombicuboctahedron. The faces of the truncated dodecahedron and truncated icosahedron correspond to those of the icosidodecahedron. The snub-dodecahedron has faces corresponding to those of the icosidodecahedron, and two sets of others corresponding to the summits of two other icosidodecahedra. The faces of the great rhombicuboctahedron correspond to those of the small rhombicuboctahedron. The faces, summits, and edges of the great icosahedron and great stellated dodecahedron correspond respectively to the faces, summits, and edges of the Platonic dodecahedron and icosahedron. The great dodecahedron and small stellated dodecahedron are self-reciprocal, both faces and summits corresponding to the faces of the Platonic dodecahedron or summits of the icosahedron. The faces of the truncated tetrahedron correspond to the faces of the octahedron or summits of the cube.

The names here used were given by Cayley.—**Logistic solid**, a solid generated by the revolution of a logarithmic curve about its asymptote.—**Plastic solid**, a solid substance whose limit of elasticity is far below its point of rupture, so that it can be shaped; thus, putty and wrought-iron are *plastic solids*.—**Platonic solid**, one of the old regular solids which wrap the center only once. They are five—the tetrahedron, the cube, the octahedron, the twenty-vertexed dodecahedron, and the icosahedron.—**Regular solid**, a polyhedron whose faces are regular polygons, all alike.—**Semi-regular solid**, a body whose edges are all of equal length, whose faces are all alike and equally incline to one another at the edges, but whose faces are not regular polygons. Two such solids are known—the rhombic dodecahedron and triacontahedron.—**Solid of least resistance.** See *resistance*.—**Solid of revolution.** See *revolution*.

Solidago (sol-i-dā'gō), n. [NL. (Vaillant, 1720). < ML. *solidago*, goldenrod (*Solidago Virgaurea*), so called from its reputed vulnerary qualities. < L. *solidus*, solid; see *solid*.] **1.** A genus of composite plants, the goldenrods, of the tribe *Asteroidae* and subtribe *Homochromae*, sometimes made the type of a further subdivision, *Solidagineae* (De Candolle, 1836). It is characterized by several-flowered small and radiate yellow heads, with a small flat usually alveolate receptacle, and an oblong involucre of erect rigid bracts which are closely imbricated in several rows and are without herbaceous tips. The oblong or obovate five- to twelve-ribbed achenes bear a copious whitish pappus of long and nearly equal slender bristles. From *Aster* which it closely resembles in technical characters, it is distinguished by its taller wand-like habit, yellow rays, smaller heads, and the absence of cordate leaves; from *Chrysopsis* and *Haplopappus* by its narrow few-flowered heads; and from *Bigeloria*, its other most

important near relative, by the presence of rays. The species have no general or very characteristic habit, being perennial herbs, usually with strictly erect unbranched stems, which bear both in the entire or serrate alternate sessile narrow stem-leaves and broader root-leaves, which taper into margined petioles. Numerous intermediate forms render many species difficult to distinguish. In the original species, *S. Virgaurea*, the golden-yellow flowers are massed in small clusters which form an elongated or interrupted spike, whence the popular name *goldenrod*. The typical inflorescence, however, is a terminal pyramidal panicle of determinate development composed of numerous recurving and scorpioid one-sided racemes, best seen in *S. Canadensis* and *S. rugosa*. In other species the flowers form a dense thyrsus of straight and terete crowded racemes, as *S. speciosa*, of the Atlantic and interior United States. A few others from the Ohio and Mississippi valleys, as *S. rigida*, produce nearly level-topped cymes. Four other cymose species were formerly separated as a genus, *Edithia* (Nuttall, 1818), distinguished by lack of scorpioid branchlets and by their linear entire ones- to five-nerved leaves, including the widely distributed species *S. lanceolata* and *S. Caroliniana* (*S. latifolia*), and connecting with *S. pauciflorula*, of the southern states and the Bahamas, formerly separated as a genus, *Chrysoma* (Nuttall, 1840), because of its shrubby stem and few-flowered heads with one to three rays. Several other species are slightly aberrant: *S. multiradiata*, of the Rocky Mountains, sometimes has twelve rays, others usually five; *S. discolor*, a racemose Gulf species, is wholly without rays and has a purplish pappus; this, with *S. sparsiflora* of northern rocks and *S. petiolaris* of southern pine-barrens, varies also in the spreading tips of the involucral bracts. *S. bicolor* is remarkable for its cream-colored flowers. *S. serotina*, of pine woods near Wilmington, North Carolina, blooms in May; *S. uliginosa*, of northern peat-bogs, in July; *S. juncea* and *S. elliptica* in August; and *S. rugosa*, *S. Canadensis*, and most others mainly in September; *S. nemoralis* and *S. ca-*

gia continue well into October. The genus is one of the most characteristic of the United States, numerous both in species and in individuals, and not entirely wanting in any region. In the northern and central States it gives to the landscape much of its beauty, and is an important element of the prevailing yellow of autumn. There are nearly 100 species, of which 80, besides more than 30 important varieties, are natives of the United States, and the others are nearly all American, 9 of them occurring in Mexico 2, 3, or 5 in South America (3 in southern Brazil, 2 in Uruguay, and 1 in Chili), and 1 in Haiti. Only 2 species are natives of the Old World, *S. littoralis*, limited to the Tuscan and Ligurian coast, and *S. Virgaurea*, which extends from Mount Tarnassus north and west throughout Europe and into Siberia, Alaska, New York, and New England, in many widely differing varieties. Those of the United States are all, with 5 exceptions, confined to them and to British America (into which 32 extend), and are mainly natives of the Atlantic and central States. Numerous isolated species are southern; the northern are mostly of wider distribution and more abundant in individuals; 11 species are mainly confined to the high northern, 12 to the northeastern, 24 to the southern, 8 to the southwestern, 10 to the Pacific States; 6 belong to the Mississippi valley, of which *S. missouriensis* is the only one widely distributed; 2 species, *S. odora* and *S. sempervirens*, extend throughout the Atlantic coast from Canada to Mexico, and the latter, the salt-marsh goldenrod, reappears at the Azores and at San Francisco. Forty-two species occur in the northeast quarter of the United States, 53 in the Southern States, and about 14 among the Rocky Mountains. *S. Canadensis*, the most numerous and most typical species, is also the one most widely diffused through the United States, followed next by *S. nemoralis* and *S. rugosa*. The species of this genus range from beyond 66° N. latitude to the city of Mexico, and from alpine summits to the sea-level; several are mostly confined to swamps, as *S. patula*, and a few to woodland borders, as *S. eximia* and *S. bicolor*, but most are plants of dry open soil, especially *S. nemoralis*. In parts of the Atlantic coast the name *goldenrod* is locally confined to *S. odora*, the sweet goldenrod of authors, which contains in its dotted leaves an aromatic and stimulating volatile oil of an anise odor and pale greenish-yellow color; it is also carminative and diaphoretic, and its infusion is used to relieve spasmodic pains and nausea; its dried flowers and leaves have been employed as a beverage, under the name of *Blue-Mountain tea*. *S. Virgaurea*, the goldenrod of Europe, contains an astringent and tonic principle, and was long in esteem for healing wounds.

herbalists of two and three centuries ago pronouncing it "one of the most noble wound-herbs," and prescribing "a tea of the young leaves, green or dry." It was also once in repute in Europe as a dye, and a variety of *S. nemoralis* is locally called *dyer's-weed* in America. *S. Canadensis* and others have been popularly known as *yellow-weed*, and *S. racemosa* as *butter-weed*. *S. rigida* is also a reputed astringent. The goldenrod has been recommended by many as the national emblem of the United States.

Syn. 1. *Solitude*, *Retirement*, *Seclusion*, *Loneliness*, *Lonesomeness*. *Solitude* is the condition of being absolutely alone, whether or not one has been with others, or desires to escape from them; as, the *solitude* of the Sphinx. *Retirement* is comparative *solitude*, produced by retiring, voluntarily or otherwise, from contact which one has had with others. *Seclusion* is stronger than *retirement*, implying the shutting out of others from access: after the Restoration Milton for safety's sake kept himself in *retirement*; indeed, except to a few trusted friends, he was in complete *seclusion*. *Loneliness* expresses the uncomfortable feelings, the longing for society, of one who is alone. *Lonesomeness* may be a lighter kind of *loneliness*, especially a feeling less spiritual than physical, growing out of the animal instinct for society and the desire of protection, the consciousness of being alone; as, the *lonesomeness* of a walk through a cemetery at night. *Lonesomeness*, more often than *loneliness*, may express the impression made upon the observer.

solmization (sol-mi-zā'shon), *n.* [*< F. solmisation*; as *solmizate* + *-ion*, Cf. ML. *solmificatio* (-n-).] In music, the act, process, or result of using certain syllables to name or represent the tones of the scale, or of a particular series, as the scale of C. The oldest and most important system of solmization that is attributed to Guido d'Arezzo, early in the eleventh century; though this in turn appears to have been sug-

gested by a similar usage among the ancient Greeks. (See *gamut*.) The series *ut, re, mi, fa, sol, la* (derived from the initial syllables of the lines of a hymn to St. John, beginning "Ut quænt laxis") was applied to the tones of each of the hexachords then recognized. (See *hexachord*.) When a melody exceeded the limits of a single hexachord, a change from one series of syllables to another was made, which was called a *mutation* or *modulation*. Early in the sixteenth century, when the modern octave scale became established, the syllable *si* (probably taken from the initials of the last line of the above hymn) was added for the seventh or leading tone. Somewhat later *do* was substituted in Italy and Germany for *ut*, on account of its greater sonority. The series thus formed is still in use, though other systems have been proposed. Such other systems are *do-cization* (*do, ce, di, ga, lo, ma, ni*), also called *do-cization*; *bebization* (*ba, be, ce, de, me, fe, ge*); and *damezation* (*da, me, ni, po, tu, la, be*). In England and America, from before the middle of the seventeenth century to the beginning of the nineteenth, an abbreviated system was used, including only *mi, fa, sol, la*. The ideal application of solmization involves calling whatever tone is taken as the key-note *do*, irrespective of its pitch, and adjusting the other syllables accordingly, so that the scale-tones shall always be named by the same syllables respectively, and the various intervals by the same combination of syllables. This system is often called that of the *movable do*, since the pitch of *do* is variable. What is called the *fixed-do system* has also had considerable currency in Italy, France, and England, according to which the tone *C* is always called *do*, *D* *re*, *E* *mi*, etc., and this too when the pitch of these tones is chromatically altered, the system therefore following the arbitrary features of the keyboard and the staff notation. This system is regarded by many musicians as contrary to the historic and logical idea of solmization, and its use in England and America is decreasing. The most important special application of solmization in musical study is that of the *tonic sol-fa system* (which see, under *tonic*), the syllables of which are *doh, ray, me, jah, soh, lah, te*. In the *movable-do system* the sharp of any tone is indicated by a syllable beginning with the same consonant as that of the tone, and using the vowel *i*: as, *di* for *do*, *fi* for *fa*, etc.; and similarly the flat of any tone is indicated by a syllable using the vowel *e*: as, *ne* for *mi*, *le* for *la*, etc. The minor scale is solmized in two ways: either beginning with *la*, and using the same syllables as in the major scale; or beginning with *do*, and using such modified syllables as may be needed (*do, re, ne*, etc.). The great utility of solmization lies in its offering an abstract vocal notation of musical facts, whereby they may be named, remembered, and studied. Also *solmisation*, *solmization*, *solfegeo*, and *sol-faing*.

solo (sō'lō), *a.* and *n.* [*< It. solo*, alone, *< L. solus*, sole; see *sole*.] 1. *a.* In music, alone; not combined with other voices or instruments of equal importance; not concerted. A solo passage may be accompanied, however, by voices or instruments of less importance.—**Solo organ**, in *organ-building*, a partial organ introduced into large instruments, containing stops of special power or effectiveness, such as are used in producing striking solo effects. Its keyboard is usually the upper one when there are four, or the lower when there are three. Its stops are often connected with a special bellows, which is weighted with extra weights; they are then said to be "on a heavy wind." tiō(n-), a loosing, dissolving, *< solvere*, pp. *solutus*, loose, resolve, dissolve: see *solve*.] 1. The act of separating the parts of any body; disruption; rupture; fracture; breach: as, a *solution* of continuity (see below).—2. The transformation of matter from a solid or gaseous state to the liquid state by means of a liquid called the *solvent* or *menstruum*; the state of being dissolved. The nature of the phenomenon depends upon whether chemical action is or is not present. Solution in the physical sense—the common and proper use of the word—is illustrated by dissolving sugar or salt in water, or silver in mercury; here, and in similar cases, when by the removal of the liquid (as by evaporation) the original solid is obtained, the process is essentially a change of molecular state, from the solid to the liquid, and hence accompanied by the absorption of heat; this is strikingly seen in freeing mixtures. The word is not infrequently used, however, when the phenomenon is one of chemical combination only, as when silver dissolves in nitric acid, forming a new substance, silver nitrate; this, as is generally true of chemical union, is accompanied by the evolution of heat. The two phenomena, physical and chemical, may both be present in solution at the same time, and the line between them often cannot be sharply drawn; glacial acetic acid dissolves in water and at the same time combines with it, the liberation of heat of the chemical part of the process overbalancing the absorption of heat in the physical. The solution of a gas in a liquid, as of ammonia gas in water (also called *absorption*), is essentially the physical process of the change of the gas to the liquid, and hence is accompanied with the evolution of heat. The term *solution* is also sometimes applied to the absorption of gases by solids, as when palladium absorbs or dissolves hydrogen gas, forming a true alloy with it. The solubility of any solid is constant at a given temperature, and may be accurately determined by experiment. It may be increased or diminished by the presence of other substances in solution. The solubility of any gas also is constant under the same conditions. It varies with the temperature, the pressure, the nature of the liquid, and the matters in solution in it. In a mixture of gases, each is dissolved in the same quantity as if it were present alone under the same tension as in the mixture.

3. The liquid produced as a result of the process or action above described; the preparation made by dissolving a solid in a liquid; as, a *solution* of salt, soda, or alum; *solution* of iron, etc.—4. A liquid or dissolved state or condition; unsettled state; suspense.

Lowell, *Among my Books*, 1st ser., p. 313.

5. The act of solving, working out, explaining, clearing up, or settling, or the state of being solved, explained, cleared up, or settled; resolution; explanation; as, the *solution* of a difficult problem or of a doubt in casuistry.

It is according to nature no man to do that wherby he shulde take . . . a praye of a nother mannes ignorance. Of this matter Tulli writeth many prope examples and quicke *solutions*. Sir T. Elyot, *The Governour*, iii. 4.

$$(c_2 - c_3) \sqrt[3]{H - c_1 U} - (c_3 - c_1) \sqrt[3]{H - c_2 U} \\ = (c_1 - c_2) \sqrt[3]{H - c_3 U} = 0.$$

somital (sō'mi-tāl), *a.* [*< somite + -al.*] Same as *somitic*.

somite (sō'mit), *n.* [*< Gr. σῶμα, body, + -ite².*] An actual somatome; any one morphological segment of an articulated body, such a body being viewed as composed of a longitudinal series of somites; an arthromere or metamere of an articulate invertebrate or a diarthromere of a vertebrate; such a segment considered with or without the appendages it may possess; in the latter restricted sense, a metamere minus its appendages, or a segment of the soma or trunk without the limbs it may bear. The term sometimes extends to ideal somatomes, or to the metameres of which an organism is theoretically assumed to consist; but it is especially applied to the actual segments of such invertebrates as insects, crustaceans, and worms, whose body-rings are usually evident, though some or other of them may coalesce, as into a cephalothorax, etc. In such cases the primitive or morphological somites are usually recognized and reckoned by their respective pairs of appendages. Separate somites, continued throughout the body, are evident in the rings of earthworms and other annelids.

In arthropods the typical number of somites is supposed to be twenty or twenty-one, numbers often actually recognizable. In insects the head is assumed to have six or seven somites, the thorax has normally three (see *prothorax*, *mesothorax*, and *metathorax*), and the abdomen is supposed to have ten or eleven. Each of these somites is invested and indicated by a body-ring or crust of integument, primitively or typically composed of eight sclerites, which may variously coalesce with one another, or with pieces of another somite, or both. Those sclerites which ordinarily remain distinct, and thus can be identified, take special names, as *tergite*, *pleurite*, *sternite*, *scutellum*, etc., *epimeron*, *epipleuron*, etc. Appendages of somites are limbs in the broadest sense, under whatever modifications; and these modifications are usually greatest at the cephalic and caudal ends of the body, as into eyestalks, antennae, palpi, mandibles, maxillae, maxillipeds or gnathopods, etc., of the head, and stings, claspers, or other anal armature. Intermediate somitic appendages are ordinary legs and wings, as of the thorax of insects, and the pereopods, pleopods, chelae, rhipidura, telson, etc., of the thorax and abdomen of crustaceans. In worms such appendages chiefly occur in the form of parapodia (neuropodia and notopodia). See *sclerite*, and enter under *Amphithoe*, *Apus*, *Euthus*, *Scorpionidae*, *Elatidae*, and *cockroach*.

somitc (sō-mit'ik), *a.* [*< somite + -ic.*] Having the character of a somite; somatonic; metameric; of or pertaining to somites; as, the *somitc* divisions of the body; a *somitc* ring or joint; a *somitc* appendage.

The sleeping condition is shown by the absence of the usual reaction to sense-impressions, and usually by the failure to recall what has been done during the somnambulist period. With many recent writers, however, the word is used, quite independently of any consideration of movements which the somnambulist may or does execute, as nearly synonymous with *trance*, *mesmerization*, or *hypnotism*, and exactly so with *somnolism*. It is generally considered under the two main conditions of the idiopathic, spontaneous, or self-induced and the artificial or induced. Compare *somnolism*. Also called, rarely, *noctambulism*.

In *somnambulism*, natural or induced, there is often a great display of intellectual activity, followed by complete oblivion of all that has passed.

In music, in the seventeenth and eighteenth centuries, any composition for instruments: opposed to *cantata*. These old sonatas were usually in more than one movement. The succession of sections and the relations of keys are open to considerable variation, and episodes often occur. Specifically—2. A short poem in fixed form, limited to fourteen lines with a prescribed disposition of rhymes. The form is of Italian origin. A sonnet is generally written in decasyllabic or five foot measure; but it may be written in octosyllables. It consists of two divisions or groups of lines: (1) a major group of eight lines or two quatrains, and (2) a minor group of six lines or two tercets. The quatrains are arranged thus: a, b, b, a; a, b, b, a; the tercets, either c, d, c, d, or c, d, c, d, c, d, c. In modern French examples the order of the tercets is generally c, d, c, d, c, d. There are various deviations from the sonnet as thus described; but by purists the above is regarded as the orthodox form, established by long practice and prescription, all others being ranked simply as quatrains or what Lamb called *fourteeners*. With regard to the material of the poem, it is generally considered that it should be the expression of a single thought, idea, or sentiment.

I can best allow to call those *Sonnets* which are of fourteen lines, every line containing tenne syllables. Guescigne, Notes on Eng. Verse (ed. Arber), § 14.

(Linnaeus, 1757), < Ar. *sōphōra*, a yellow plant (applied to one faded), < *asfar*, yellow; see *saffron*.] A genus of leguminous plants, of the suborder *Papilioideae*, type of the tribe *Sophoreae*. It is characterized by flowers with a broadly clavate or orbicular banner petal and oblong wings and keel, grouped in terminal racemes or panicles, and followed by thick or roundish or four-winged pods which are constricted into a succession of neck-like joints (see cut under *moniliform*), and are usually indehiscent. There are about 50 species, natives of warm regions of both hemispheres. They are trees and shrubs, rarely perennial herbs, and bear odd-pinnate leaves, usually with very numerous small leaflets, but sometimes only a few, and then large and rigid. The flowers are white, yellow, or violet, and highly ornamental. Three species occur within the United States: *S. secundata*, the coral-bean of Texas (see *fruticosa*); *S. affinis*, a small tree of Arkansas and Texas with hard heavy, coarse-grained yellow and finally red wood, and resinous pods, from which a domestic ink is made; and *S. tomentosa*, a shrub of the Florida coast, with showy yellow flowers, also widely distributed along tropical shores of Amer-

rea, Africa, and Australia, and abundant on Fiji Island sea-beaches, where it is known as *kau-ni-alewa*, or women's tree. *S. tetrapleura* of New Zealand is there known as *la-haranga* or *kourhai* (for its variety *Macnabiana*, see *pehu*). *S. japonica* is the Chinese or Japanese pagoda-tree or yem-pi, a very handsome quick-growing tree reaching to feet in height, with dark-green younger branches and deep blue-green leaves, sometimes cultivated, especially for its large panicles of small whitish autumnal flowers. Its hard compact wood is valued for turners work; all parts are purgative; the austere pulp of the pods dyes yellow; and the flowers (called in Chinese *wai-fa*) furnish a yellow dye greatly valued in China. For this tree is cultivated in several provinces, from which the dried flowers are exported in small sacks and used to dye blue cloth green, and to dye yellow the silk garments of the mandarins and the rush-mats which form the Chinese sails, beds, bags, and floor-matting.

For other important genera, see *Myrocydon* and *Cadastreia*. Gr. ψυχή, etc.); origin unknown. The word has been compared with Gr. αἰθήρ, quick-moving, changeful, and with sêl (see sêl); also with L. saeculum, age (life, vitality ?) (see secl, secular).]* 1. A substantial entity believed to be that in each person which lives, feels, thinks, and wills. Animals also, and even plants, have been thought to have souls. Primitive peoples identify the soul with the breath, or something contained in the blood. Separated from the body, it is supposed to have some imperfect existence, and to retain the form of the body as a ghost. The verses of Davies (see below) enumerate most of the ancient Greek opinions. The first is that of Anaximander and of Diogenes of Apollonia; the second is that of Heraclitus; the third is that of Empedocles; the fourth is that attributed to Empedocles by Aristotle; the fifth is that of Democritus and other Pythagoreans, as Simplicius in the "Phaedo"; the sixth is attributed wrongly to Galen; the seventh is that of Democritus and the atomists; the eighth is attributed by some authorities to the Pythagoreans; and the ninth is that of the Stoics. Aristotle makes the soul little more than a faculty or attribute of the body, and he compares it to the "axness" of an ax. The scholastics combined this idea with that of the separability and immortality of the soul, thus forming a highly metaphysical doctrine. Descartes originated distinct metaphysical dualism, which holds that spirit and matter are two radically different kinds of substance—the former characterized by consciousness, the latter by extension. Most modern philosophers hold to monism in some form, which recognizes only one kind of substance. That the soul is immortal is a very ancient and widely diffused opinion; it is also commonly believed that the soul has no parts. A soul separated from the body is commonly called a *spirit*, not a *soul*. In biblical and theological usage "soul" (*ψυχή, psyche*, also rendered "life") is sometimes used for the non-corporal nature of man in general, and sometimes, in distinction from *spirit*, for the lower part of this non-corporal nature, standing in direct communication with the body, and regarded as the seat of the emotions, rarely of will or spirit. Some theologians minimize the distinction between *soul* and *spirit*, making them mere aspects or relations of the same substance, while others have made them distinct substances or distinct entities.

For of the soule the bodie forme doth take;

For soule is forme, and doth the bodie make.

Spenser, Hymn in Honour of Beauty, l. 132.

And others thinke the name of soule is vaine,

And that we onely weyl-mixt bodies are.

All Souls' day, in the *Rom. Cath. As long as the soul was supposed to be a material thing (which was the usual ancient opinion), it was naturally believed to have a distinct place. Later the knowledge of the functions of the nervous system, and their centralization in the brain, showed that the soul was more intimately connected with that than with other parts of the body; and it was vaguely supposed that the unity of consciousness would in some measure be explained by the hypothesis of a special seat of the soul in the brain. The commonest primitive notion was that the soul was resident in the blood or in the heart. Either the whole soul or its parts were also located in the bowels, bones, liver, gall, kidneys, and other organs. The doctrine that the soul is in the brain seems to have originated in Egypt, and found many partial adherents in antiquity, but was not generally accepted before modern times. The Neoplatonists held that the soul is wholly in the whole body and wholly in every part. Descartes placed the soul in the pineal gland, and other physiologists of the seventeenth century located it in different organs connected with the brain. Leibnitz introduced the theory that it resides at a mathematical point, which has found eminent supporters, some of whom regard this point as movable. Others hold that any conception of consciousness which forces its adherents to such a conclusion ought to be considered as reduced to an absurdity. Recent observations concerning multiple consciousness strengthen indications previously known that the unity of consciousness is somewhat illusory; and the anatomy of the brain does not support the notion of an absolute centralization of the power of forming ideas.—**Sentient soul**, the soul as affected by the senses, or as possessing sentience. = *Syn.* 1 and 2. *Intellect, spirit*, etc. See *mind*, 4. *Ardo, force.*

Cf. *sound*³.] A narrow passage of water not a stream, as a strait between the mainland and an isle, or a strait connecting two seas, or connecting a sea or lake with the ocean: as, Long Island Sound; the Sound (between Denmark and Sweden).

Behold, I come, sent from the Stygian *sound*,
As a dire vapour. *B. Jonson*, *Catiline*, i. 1.

And, with my skates fast-bound,
Skimmed the half-frozen Sound.

sound³ (sound), *n.* [*< ME. sounde; cf. Icel. sund-magi, the sound of a fish, lit. 'swimming-maw': see sound² and maw¹.*] In *zool.*: (*a*) The swimming-bladder or air-bladder of a fish. The sound is a hollow vesicular organ, originating from the digestive tract—in fact, a rudimentary lung, the actual homologue of the lungs of air-breathing vertebrates, though in fishes, as in other branchiata, respiration is effected by gills. (See *air-bladder*.) Some fishes' sounds are an esteemed article of food, as that of the cod, which when fried is something like an oyster so cooked; others are valuable as a source of isinglass.

To measure the depth of; fathom; try or test, as the depth of water and the quality of the ground, by sinking a plummet or lead attached to a line on which is marked the number of fathoms. Machines of various kinds are also used to indicate the depth to which the lead has descended. A cavity in the lower end of the lead is partially filled with

the mind of; search out the intention, opinion, will, or wish of.

It is better to *sound* a person with whom one deals, afar off than to fall upon the point at first, except you mean to surprise him by some short question.

II. intrans. 1. To use the line and lead in searching the depth of water.

For certes, lord, so sore hath she me wounded
That stood in blake, with lokynge of hire enen,
That to myn hertis botme it is *sounded*.

Chaucer, Troilus, ii. 535.

3. To descend to the bottom; dive: said of fish and other marine animals. When a sperm-whale sounds, the fore parts are lifted a little out of water, a strong spout is given, the nose is dipped, the back and small are rounded up, the body bends on a cross-axis, the flukes are thrown up 20 or 30 feet, and the whale goes straight down head first, in less than its own length of water.

The sensation produced through the ear, or organ of hearing; in the physical sense, either the vibrations of the sounding-body itself, or those of the air or other medium, which are caused by the sounding-body, and which immediately affect the ear. A musical sound, or *tone*, is produced by a continued and regular series of vibrations (or, in the physical sense, may be said to be these vibrations themselves); while a *noise* is caused either by a single impulse, as an electrical spark, or by a series of impulses following at irregular intervals. A sounding-body is a body which is in such a state of vibration as to produce a sound (see *vibration*). Thus, a tuning-fork, a bell, or a piano-string, if struck, will, in consequence of its elasticity, continue to vibrate for some time, producing, in the proper medium, a sound; similarly, the column of air in an organ-pipe becomes a sounding-body when a current of air is continually forced through the mouthpiece past the lip; again, an inelastic body, as a card, may become a sounding body if it receives a series of blows at regular intervals and in sufficiently rapid succession, as from the teeth of a revolving cog-wheel. The vibrations of the sounding-body are conveyed to the ear by the intervening medium, which is usually the air, but may be any other gas, a liquid (as water), or an elastic solid. The presence of such a medium is essential, for sound is not propagated in a vacuum. The vibrations of the sounding-body, as a tuning-fork, produce in the medium a series of waves (see *wave*) of condensation and rarefaction, which are propagated in all directions with a velocity depending upon the nature of the medium and its temperature: for example, the velocity of sound in air is about 1,090 feet per second at 32° F. (0° C.), and increases slightly as the temperature rises; in other gases the velocity varies inversely as the square root of the density; it is consequently nearly four times as great in hydrogen. In liquids the velocity is greater than in air—for water, somewhat more than four times as great. In solids the velocity varies very widely, being relatively small in inelastic substances like wax and lead, and very great (two to three miles per second) in wood and steel. Sound-waves may differ (1) in their wavelength—that is, in the number of vibrations per second; (2) in the amplitude of the motion of the particles forming them; and (3) in their form, as to whether they are simple, or consist of a single series of pendulum-like vibrations, or are compound, and formed of several such series superimposed upon each other. Corresponding to these differences in the sound-waves, the sounds perceived by the ear differ in three ways: (1) They differ in *pitch*. If the sound-waves are long and the number of vibrations few per second, the pitch is said to be *low* and the sound is called *grave*; as the number of vibrations increases, the pitch is said to *rise* and the sound to be *higher*; if the number of vibrations is very great and the length of the waves correspondingly small, the sound becomes shrill and piercing. It is found that the vibrations must be as numerous as 24 per second in order that the ear may be able to unite them as a continuous sound. Similarly, if the vibrations exceed 20,000 to 30,000 per second, they

cease to produce any sensation upon the ear. (2) Sounds differ in *intensity* or *loudness*. Primarily the intensity of the sound depends upon the amplitude of the vibrations; it diminishes with the square of the distance from the sounding-body; it also diminishes as the density of the air or other medium decreases, and is increased by the proximity of a sonorous body which can vibrate in unison with it. (3) Sounds differ in *quality* or *timbre*, that property by which we distinguish between the same tone as sounded upon two different musical instruments, as a piano and a violin. This difference is due to the fact that a note produced by a musical instrument is in general a compound note, consisting of the fundamental note, the pitch of which the ear perceives, and with it a number of higher notes of small intensity whose vibrations as compared with the fundamental note are usually as the numbers 2, 3, 4, 5, 6, etc. These upper notes, harmonics or over-tones (see *harmonic*), blend with the fundamental note, and upon their number and relative intensity, consequently, the resultant combined effect upon the ear, or the quality of the note, depends. Sound-waves may, like light-waves, be reflected from an opposing surface (see *reflection*, *echo*, *resonance*); they may be refracted, or suffer a change of direction, in passing from one medium to another of different density; they may suffer diffraction; and they may also suffer interference, giving rise to the pulsations of sounds called *beats*. See *beat*, 7.

2. A particular quality or character of tone, producing a certain effect on the hearer, or suggesting a particular cause; tone; note; as, a joyful sound; a sound of woe.

When the cup *d* reaches bottom, the hooks *b* drop into the position shown in *E*; the sinker or lead then drops over, releasing the cup, and this, with its specimen and the hooks, is drawn to the surface.

for raising water from a great depth for exam-
ination and analysis. It is generally made of wood,
and has valves opening upward in the top and bottom. It
is fixed on the sounding-line over the lead, so that the
water passes through it as the line descends; but when it
is drawn up the force of gravity closes the valves, thus re-

taining the contents. It often contains a thermometer
for showing the temperature below the surface.

(c) Supremacy or dominion; hegemony; applied to the relation between a powerful state and other states or regions: as, Rome's *sovereynty* over the East; Great Britain holds the *sovereynty* of the seas. (d) The supreme, absolute, uncontrollable power by which any state is governed (Cooley); the political authority, whether vested in a single individual or in a number of individuals, to order and direct what is to be done by each individual in relation to the end and object of the state (Halliwell). It is essential to the modern conception of sovereignty that it should be exclusive of any other human superior authority, should be wielded by a determinate person or organization of persons, and should be on the whole habitually obeyed by the bulk of the community. Thus, in the United States, sovereignty is vested in the body of adult male citizens. The claim that each State—that is, the adult male free citizens of each State—possessed a separate sovereignty was one of the elements of controversy involved in the civil war.

I state Austin's doctrine of *Sovereignty* in another way, more popularly, though without, I think, any substantial inaccuracy. It is as follows: There is, in every independent political community—that is, in every political community not in the habit of obedience to a superior above itself—some single person or some combination of persons which has the power of compelling the other members of the community to do exactly as it pleases. This single person or group—this individual or this collegiate Sovereign . . .—may be found in every independent political community as certainly as the centre of gravity in a mass of matter. If the community be violently or voluntarily divided into a number of separate fragments, then, as soon as each fragment has settled down (perhaps after an interval of anarchy) into a state of equilibrium, the Sovereign will exist and with proper care will be discoverable in each of the now independent portions. The *Sovereignty* over the North American Colonies of Great Britain had its seat in one place before they became the United States, in another place afterwards; but in both cases there was a discoverable Sovereign somewhere. This Sovereign, this person or combination of persons, universally occurring in all independent political communities, has in all such communities one characteristic common to all the shapes *Sovereignty* may take, the possession of irresistible force, not necessarily exerted, but capable of

 origin obscure; cf. *seu* 2.] 1. A nutritious article
 of food made from the farina remaining among
 the husks of oats, much used in Scotland and
 formerly in Northumberland. The husks (called in
 Scotland *bedds or sides*) after being separated from the oat-
 meal by the sieve, still retain a considerable portion of
 farinaceous matter. A quantity of the husks is steeped in
 water till the farinaceous matter is dissolved and until
 the liquid has become sour. The whole is then put into
 a sieve, which allows the milky liquid to pass through into
 a barrel or other vessel, but retains the husks. The starchy
 matter gradually subsides to the bottom of the barrel. The
 sour liquor is then decanted off, fresh water is stirred into
 the deposit that is left, and the mixture when boiled,
 forms sowens. In England it is more commonly called
flumery. The singular form *sowen* is used attributively

I have been told that soy is made with a fishy composition, and it seems most likely by the taste. From a gentleman of my Acquaintance who was very intimate with one that sailed often from Tongkin to Japan, from whence their *Soy* comes, told me that it was made only with Wheat and a sort of Beans mixt with Water and Salt.

The plant is native from northern India to Japan. The cultivated plant differs somewhat from the wild, and by some authors is distinguished as *Glycine hispida*. Also *Salsola bean*.

'that which is drawn out'; < *√ spa*, draw out; cf. *Gr. σπᾶν*, draw, draw out, *Skt. √ sphā*, fatten. Cf. *span*¹, *spade*¹.] 1. The general receptacle of things; room, (a) as a character of the universe, (b) as a cognition or psychological phenomenon, (c) as a mathematical system. That which is real about space is that the manifoldness of the universe is subject to certain general laws or limitations. In this respect it is like any other uniformity of nature; it is peculiar only in the peculiar way in which we view it—namely, in this, that instead of thinking it, as we do other laws, as abstract and general, we seem to see it, we individualize it and its parts. This peculiarity does not, however, constitute the cognition of space as entirely *sui generis*, for there is a tendency to individualize other laws. The conception of space is formed, or at least connected with objects, by means of the so-called local signs, by which the excitation of one nerve-terminal is distinguishable from a similar excitation of another, and which are analogous to the signs by which we distinguish present experiences from memories, imaginations, and expectations. These local signs are also the origin of our idea of individuality; so that it is not strange that this mode of being becomes attributed not merely to moving objects, but to the space and time that constitute the law of motion. The celebrated doctrine of Kant was that space is a form of pure intuition—that is, an idea imported by the mind into cognition, and corresponding to nothing in the things in themselves (though he did not hold that special spatial relations were altogether illusory)—just as color is a quality of sensation which in its generality corresponds to nothing in the object, though differences of color correspond to differences in objects. That this intuition of space is individual, not general, and that no outward intuition is possible except under this form, were points also insisted upon by Kant. At present there are, broadly speaking, two views of space-perception. One is the great doctrine of Berkeley—worked out in different directions by J. S. Mill, Helmholtz, Lotze, Wundt, and others—that the idea of space is evoked under the combined influence of retinal sensations and of muscular sensations of motion. In a manner analogous to that by which the laws of dynamics have been evolved from experience. This is the theory which, under one modification or another, is held by almost all modern scientific psychologists. Some competent writers, however, oppose this, holding that "all our sensations are positively and inexplicably extensive wholes." This opinion conflicts with the usual one only in so far as it clings to the inexplicability and irrationality of space. The vulgar conception of space as a sort of thing or substance of a different category from material things, through which the latter move without sensible resistance, is acceptable to mathematicians, who find that such a construction lends itself remarkably to their diagrammatic reasoning. For the geometer, space is primarily a system of points having the following properties: (1) It is continuous. See *continuity*, 2. (2) It is unlimited, whether the part at a finite distance from a given point be limited or not. (3) It has three dimensions—that is, a set of three numbers varying continuously may be placed in continuous one-to-one correspondence with the points of space. By a continuous correspondence is meant one in which a continuous variation in one member will correspond in every case to a continuous variation in the other. (4) All the points of space have perfectly similar spatial relations. (5) It is possible for a rigid body to move in space, and such a body is fixed by the fixation of three points, but not fewer. (6) Any figure may be magnified while preserving the proportionality of all its lines. Geometers often imagine these properties to be modified. In particular, they use the hypothesis of a space of four or more dimensions. They also often suppose the principle of similar figures, or what is the same thing, the doctrine of parallels, to be false, thus producing what is known as the *non-Euclidean geometry*. This is of various kinds.

Now to pure space lifts her ecstatic stare.

G. *spanne* (> It. *spanna* = OF. *espan*, F. *empan*) = Icel. *spánn* (*spann*-) = Sw. *spann* = Dan. *spand*, a span; from the verb.] **I.** The full extent or course over which anything is stretched or prolonged; the space or time covered or included between terminal points; entire reach from end to end or from side to side: as, the span of life; the span of a bridge. As used of physical things, *span* is understood as the actual or net space or distance between bounding lines or surfaces; hence, the span of an arch is the length of the opening between the inner faces of its abutments. Compare def. 2. Often used figuratively.

The brief span of Roman literature, strictly so called, was suddenly closed under a variety of influences.

Yea, Manhood hath a wider span
And larger privilege of life than man.

Lowell, Comm. Ode.

2. A part or division of something between terminal points: as, a bridge of ten spans. In this sense a span would comprise the distance from the middle line of one pier or support to that of the next, the whole number of spans including the entire length of the structure. (The decision of the case referred to in the first quotation turned upon the distinction between senses 1 and 2.)

The word *span* does not, even in architecture, always mean a part of a structure. It is, perhaps, as often used to denote the distance or space between two columns. Such is the obvious import of the term as used in the act under consideration, not merely as a part of the structure itself, but the measure of the distance between the piers of the bridge.

U. S. Supreme Ct., March, 1888. (Judge Lamar.)

The channel spans were built out from the central pier and from the adjacent flanking spans without the use of false works in either channel. *Scribner's Mag., IV. 32.*

Between the ages of eight and nineteen the span of school-girls increases from 6 to 7.9 for letters, and from 6.6 to 8.6 for numerals. *Span* increases not only with age, but with rank in class, and it is suggested that a "standard span" be added to the items for anthropometric measurement. *Amer. Jour. Psychol., I. 193.*

4. As a measure, originally, the extent between the tips of the thumb and little finger when stretched out: the oldest use of the word in English. The *span* belongs to the system of long measure to which the cubit and fingerbreadth belong. It has always been considered as half a cubit, and still is so in several countries of Asia. The English span is 9 inches. The Swedish *spann* is an entirely different kind of measure.

Spanne, measure of the hand. *Palmus.*

A dog of a domestic breed, of medium and small sizes, with a long silky and usually curly coat, long, soft, drooping ears, feathered tail and stern, of docile, timid, and affectionate disposition, much used for sporting purposes and as pets. The most usual colors are liver and white, red and white, or black and white, in broken or massed areas, sometimes deep brown or black on the face or breast, with a tan mark over the eye. Spaniels sport or are bred into many strains, and three classes of them are sometimes distinguished: *land*, or *field-spaniels*, including the cocker and springer; *water-spaniels*; and *toy spaniels*, as the King Charles and the Blenheim. The English spaniel is a superior and very pure breed; and, although the name *spaniel* would seem to indicate a Spanish origin, it is most probably indigenous. This dog was used in the days of falconry to start the game. The King Charles is a small black-and-tan variety of the spaniel; the Blenheim is similar, but white marked with red or yellow; both should have a rounded head with short muzzle, full eyes, and well-fringed ears

and feet. The Maltese dog and the lion-dog are also small toy spaniels, used as lap-dogs. The water-spaniels, large and small, differ from the common spaniel in the roughness of their coats, and in uniting the aquatic propensities of the Newfoundland dog with the fine hunting qualities of their own race. Leading strains of the springers are the Clumber, Norfolk, and Sussex, in different colors. *2.* Figuratively, a mean, cringing, fawning person; a blindly submissive follower; from the characteristics of the spaniel in relation to its master, or when in a state of fear.

Sparking often takes place between the collecting brushes and the commutator of the dynamo. It is injurious to the machine, aside from the actual dissipation of energy which it involves. It also occurs to an injurious degree in other electrical apparatus in which currents are frequently interrupted. Various measures are resorted to for the purpose of reducing it to a minimum or avoiding it altogether. See *spark-arrester*, 3.

'sparrow-eagle,' the second element being OHG. *aro* (in comp. *-ari*), eagle: see *earn*. Cf. *sparver*, *sparin*.] 1. The house-sparrow, *Passer domesticus*, a fringilline bird of Europe, which has been imported and naturalized in America, Australia, and other countries. It is about 6 inches long and 9½ in extent of wings. The upper parts of the male are ash-gray, boldly streaked on the back with black and bay; there is a dark-chestnut or mahogany spot on each side of the neck; the lesser wing-coverts are chestnut; the median are tipped with white, forming a wing-bar; the greater coverts and inner secondaries have a black field bordered with gray; and the lower parts are ash or gray, with jet-black on the throat, spreading on the breast, and bordered on the side of the neck with white. The female is similar, but more plainly feathered, lacking the distinctive head-markings of the male. The sparrow is a conirostral granivorous bird, whose food is principally seeds and grain, yet it has been introduced in many countries for the purpose of destroying noxious insects. It is extremely hardy, pugnacious, and prolific, rearing several large broods annually. Of all birds the sparrow naturally attaches itself most closely to man, and easily modifies its habits to suit artificial conditions of environment. It is thus one of several animals, as rats, mice, and other vermin, well fitted to survive under whatever conditions man may offer or enforce; hence it wins in competition with the native birds of the foreign countries where it naturalizes, without as readily developing counteractive agencies to check its increase. It speedily becomes a pest wherever introduced, and seldom destroys noxious insects to any appreciable extent. It was brought into the United States from Germany about 1869, and is now probably more numerous than any single native bird. In New York city thousands of sparrows are sold and eaten as reed-birds. See cut under *Passer*.

2. Some or any fringilline bird resembling the sparrow, as *Passer montanus*, the tree-sparrow; one of various finches and buntings, mostly of plain coloration. In the United States the name is given, with a qualifying word, to very many small sparrow-like birds, mostly of homely streaked coloration. Chipping- or field-sparrows belong to the genus *Spizella*; crown-sparrows to *Zonotrichia*; fox-sparrows to *Passerella*; grasshopper-sparrows to *Coturniculus*; the grass-sparrow to *Pooecetes*; the lark-sparrow to *Chondestes*; sage-sparrows to *Amphispiza*; savanna-sparrows to *Passerulus*; seaside sparrows to *Ammodramus*; snow-sparrows to *Junco*; song-sparrows to *Melospiza*. See cuts under *Chondestes*, *Coturniculus*, *Embernagra*, *field-sparrow*, *grassfinch*, *sage-sparrow*, *savanna-sparrow*, *snowbird*, and *song-sparrow*.

3. Some little bird likened to or mistaken for a sparrow. Thus, the hedge-sparrow is the hedge-chantrel, *Acrocor modularis*, and some other warblers are loosely called sparrows.—**Bush-sparrow**, the hedge-sparrow, *Acrocor modularis*.—**English sparrow**, the common European house-sparrow, *Passer domesticus*: so called in the United States. See def. 1.—**Green-tailed sparrow**, Blanding's finch. See *finch*¹.—**Java sparrow**, the rice-bird of Java, *Amadina (Munia or Padda) oryzivora*, about as large as the bobolink, of a bluish-gray color with pink bill and white ear-coverts: a well-known cage-bird.—**Sandwich sparrow**, a variety of the common

savanna-sparrow found in Alaska.—**White-throated sparrow**, a crown-sparrow. (See also *field-sparrow*, *hedge-sparrow*, *hill-sparrow*, *house sparrow*, *reed-sparrow*, *satin-sparrow*, *water-sparrow*, and other compounds noted in def. 2.)
